PASSIONARITY

PASSIONARITY

Contents

Introduction

A new age is coming and its quality knows no equals in recent memory. All the humankind's accumulated experience in building social and governmental processes has absolutely nothing in common with what awaits the global civilization in future. The quality of the social processes, which are already being built today, is reaching such a stage of development that the whole well-established over the centuries reporting system and human liaison is losing its effectiveness. It is connected to new informational and technological progress, which affects the combination of environmental factors, leaving behind the usual way of people's lives and their self-organization quality.

For the past century of technological progress, civilization, due to the increase of the speed of processes, has not been able to make an absolutely different perceptual system of the objective reality, which affects the quality of society's interaction with the environment and its general goal-setting. For objective reasons, state machinery loses its effectiveness, which used to facilitate the control of social processes. Society remains all alone with its fate which is both a positive and a disruptive factor for the whole global civilization.

We will try to reconcile the social views of the world and the facts on the ground by giving a view aimed at understanding world's processes as a bunch of positive environmental factors, **meant to give society completely universal ways of own development and evolution**.

Only five years ago it was impossible to imagine such a concourse of circumstances due to which a project like that could appear in the overall informational space. Therefore, the quality of future events encourages us to make a step forward and get the go-ahead from those forces that have been the watchmen of the world for ages.

The level of the given to society freedom is a function, meant to manage a crisis situation. The whole established global industrial economy is coming to its logical end, leading our civilization to such quality, when human time will be spent not on working activities as a part of hired labor, but only on creative work and personal development. At this state of things, habitual consumption will lose its effectiveness in its influence on the economic situation in general. A human, as a function of the Pancosmic Design, will enter a new stage of development, having deepened into the world full of instrumentarium of the new age, which is a combination of the factors of new environment, giving each person an absolute freedom in self-expression.

In the upcoming age, the most precious things will be ideologemes, turning huge cross-sections of society into unity, leaving behind the value of technologies and everything material due to their time instability as they rapidly renovate. The ideas will rule the world, forming a stable development of social processes for a long period of time. The more stable the idea will be in time, the more stable will be the development of world's economy as a result of people's synchronization and creative work on its basis.

We will try to explain the connection between the idea and the quality of global processes aimed at overall creativeness. In which way are ideology and human's worldview relevant to operational system soft of computers to draw a parallel between all the already known images that find their visualization in our daily life. How can we change the quality of the processes accompanying our life by programming our own psyche? In which way do soft and operational systems influence the quality of the analysis of the objective reality, and in which way do their fundamental aims predispose creativeness or, at negative fundamental basis, destructiveness and self-destruction? How does collective psyche influence natural phenomena and eventfulness? What is love and why is it the greatest achievement? In which way do informational technologies influence the forming of one global civilization without boundaries and how does the blockchain technology contribute to it, speeding the organization process of absolutely new economy aimed at people's self-organization in the frame of new informational society?

We will not try to answer each and every of these questions and provide you with the absolute truth. We will bring forward those of them, which are, to our mind, able to encourage the understanding of the world, giving anyone an ability to answer them personally. This approach is not aimed at forming the dogmas which are impossible to debate, but predisposes research activities, accompanying process of which will be a through penetrating creative process aimed at understanding the truth.

Human's ability to self-education will be the key factor in personal development in future. The state, at which the survival problems were solved for country's citizens by the control system, is fading. Consequently, we ourselves should take control of the situation and start forming a matrix of possible states, forming a global order of the day and comprehensively coping with urgent tasks at the same time.

Information integrity and its most compliance to reality will play a crucial role in the upcoming era, developing fundamental views of the world. It will be a supreme value as it will facilitate the gathering of social processes and its accompanying future forecast. It is the forecast activities in the technology development era that loses its methodological basis splitting upon the obscurity rocks. Society loses its ability to build its life in accordance with time, which leads to family collapse and state formations.

This project is aimed at solving this problem, which is why human mind secrets are being revealed, as without the understanding of the fundamental matters, it is impossible to describe the logic of the modern world development. Everything in this world is interconnected with a supernal reality and its algorithm of functioning. Nothing is born out of oblivion, everything has its analogies in different spheres of natural phenomena and life, as human's brain is capable of generating only those things and images, which the Universe database already has information on.

We will not try to cover everyone and everything by this project as we understand that the quality of information is aimed at public that has already formed a number of matters described above, and is waiting in the wings to get support and a fold. However, we consider

that future generations will also find something personal in the information brought by us, and they will express its basic principles in individual creativity.

The new age is already developing and phase transition is done in intuitive notion in each of us, changing the understanding of the world. If we want to make a better and faster jump into the new perceived reality, we need to describe the events, which will be spoken about in this project. Obviously, each of us, one way or another, has personally formed the answers to many of the described questions that is why it is important to get the support from the outside, to fill our mind with confidence in tomorrow's day and leave, on some matters, the loneliness.

* * *

It is important to emphasize some recommendations to follow while reading. During the creation of the project the aim was to build a logical chain of cause-and-effect relations, based on the process of human interaction with the environment, producing a cohesive view of the world with each passing piece of chain. The project is written coherently so, as to fully understand and form a prominent worldview upon the read, you should closely follow the given order during the reading as not to lose the general logic of things. If you have a feeling that some described thoughts cannot set to proper understanding, do not be upset – the understating will come on the basis of the following pieces. In the end, after having read the whole work, you will have a holistic understanding of the information on the basis of which anyone will be able to describe possible development of global events that will entail active actions aimed at forming a new reality.

Worldview

To move forward, we need to define the worldview, on the basis of which today's reality is built. If we consider a human as an informational-algorithm system, then a human's worldview, just like in computing machines, is its operational system. The system which, at external considering, is a thing in itself and provides the interaction with the sense organs of the bearer.

If we look at a worldview within the research of its internal principles, it may be linked to the informational systems of personal computers. In this case, they should be divided into two groups[1]:

1. **Close** source code system;
2. **Open** source code system;

In both cases the logic of operational systems is developed by third-party developers. The user accepts the ideology of one of them and adopts it. The differences in the approaches are identified on the level of advanced usage of the systems. If, in the first case, the user is limited in the access to source codes and just accepts the fact that the system lives its own life updating, giving access to external soft and so on, then, in the other case, the user has a free hand concerning operational system as, at wish, the user can cardinally change all the content and have total control of the operational system. The most important thing is that in the case with **open** source codes, OS won't make a single step without a direct command of the system user as it has an algorithm of direct submission to the user without any elements of "discretionary powers", algorithms of which are brought by the third-party developers. In other words, the user is able to control the system behavior at its interaction with each of the interfaces of the computer and change the configurations of its core.

The differences in the approaches are defined by the corporate logic inside the companies developing operational systems. In the first case, commercial secret haunts the closed nature of the system, where the user is seen as a final consumer whose pocket finances the corporation directly or indirectly. The **closed** nature of the system is a mechanism insuring the corporation from its intellectual product copying. Corporations run a privacy policy and other protection systems for strategically important information.

In the second case, operational systems are developed by open communities of developers whom anyone, who has the skills of software development, can join. On the contrary, in respect of the first case, there's a policy of strict selection of the staff.

Even on the basis of this approach during system analysis, nowadays there are a number of rules. The transfer to **open** systems is commonly carried out from closed systems.

---

1   This analogy is not made by chance. During the book it will be emphasized that the world is moving into the new era marked by the appearance of open source code systems, which are embodied not only in the world of informational technologies.

At first thought, both types of system logic are in confrontation mode, however on close scrutiny there is a principle of adoption of ideas and technological solutions.

The user, who deals only with the systems of the first type during his life, as a rule, contents himself with user interface and often doesn't go to the heart of the operational system, eventually reaching the usage level in automatic mode, as exemplified by closing informational and warning windows, installing programs without looking and other actions.

At transfer to the second-type systems, as a rule, the user enters an analyzing and interpreting mode which is a pure advantage towards the first-type systems, where at the level of development, the user is seen as some kind of reaction machine with a minimum set of parameters, theoretically, performing a function of product payment when new versions of software are released. The logic of the second-type systems has a number of conscious advantages only in case when the user is already in contact with it. Otherwise, everything we have is of no interest as there is no idea of different interconnection logic with the computer's interface.

As the user gets familiar to the new system, he begins to see more clearly what computer interfaces are, and what an interconnection is between a human and those interfaces through operational systems. He begins to see the whole information-algorithm system which is called a computer and, eventually, the differences in information processing between the two types of system construction logic are not seen anymore. There's this certainty that the operational system should be controlled only by the user, who has access to the superuser rights and that is that.

Now let's leave the technological ins and outs and come up right to a human, leaving the analogy itself as a principle.

Humans' worldview has the same functions and is divided into two similar groups:

1. *The worldview, stamped by the matrix*, which is a bearer (user) control system, serving closed corporations..

2. *Conscious worldview, controlled by the user* and adopting to time realities not in the automatic mode of the "corporate updates", but in the mode of controlling psyche configuration by the direct bearer of the given worldview.

All the social, mainstream structures are working to develop the first-type worldview. A human, from this point of view, is seen as an object to control, responding to external irritants. The system task is to provide the predictability of the object's behavior, i.e. to program a human worldview in such a way, so that the respond to irritants would be most predictable. The education level of an individual is defined by the breadth of irritants processed with respond at the stage of working activity to the extent permitted by the system. Individual's psyche both stays to the full extent out of his control and remains, due to the worldview, a part of the system of individual's external control, where the control over informational interfaces of psyche belongs to external control system, again, due to an individual's foreign worldview.

The second type of the worldview is a consequence of an individual's interaction with a wide range of information, sources of which are mainly not controlled by the system directly or controlled but partially. It should be noted that the controllability is a relative thing, and it is often defined by the cumulative characteristics of the freedom of will and choice, which will be discussed in detail in the following parts. Taking the first-type worldview into consideration from the second-type point of view, it, this first-type worldview, is no longer a worldview in a general sense. The thing is that at responding approach to the "analysis" of the objective reality, there is a huge layer of key events and peculiarities of the psyche of each individual "under the hood". The rest world outlook can be built on their basis.

It can therefore be concluded that the external cultural matrix is a programmable environment under control of the control system. This matrix mostly performs the function of the projector of the key behavior algorithms to the worldview of each individual and, consequently, to collective psyche in general.

We shall now consider the information processing mechanism closer.

From Psyche to Consciousness

Having addressed the question of the worldview as being a system of incoming information processing and a system of interaction with a bearer's psyche interfaces, we will now go into the question of psyche functioning.

A human, being a multilevel information-algorithm system meant for interacting with the outside physical world, is a bearer of psyche with predetermined principal characteristics. These principles are realized on the basis of physiological qualities of a separate individual, external cultural factors, and on the basis of energy-informational interaction with the inner world of a person. They are defined by the level of his intelligence while understanding laws of nature and social processes.

Psyche, in its general sense, can be compared to a nugget, walls of which are covered with earth material. The task of every person, in this case, is not only to clean the nugget from foreign elements, but also to do the gem-cutting in order to achieve the perfect shape. The perfect shape of gem-cutting is Consciousness in its highest realization. If we look at this analogy from the control perspective, then psyche, in its original, is most affected by external influences, and is not duly capable of rebuffing cultural matrix manifestations. Consciousness, on the other hand, is a tuning fork resonating with Universe pulsations, and, due to the cast-off excesses, it is able to generate matrix discharges and change the functioning algorithm in parts of its elements.

Psyche, in its primary realization, is an end in itself of the society's control system, whose software developers put emphasis on each element of the system to act within the statistical faults.

A person's worldview is a mechanism, contributing the process of Consciousness development, or, being within the frames of its closed codes – in the denial of this process.

Following the given logic, let's define what earth material, in need of its processor, is. It is, in the first place, instincts, whereby not all of them are absolute evil, and part of them can perform a complex of vitally important functions. An end in itself is what really matters as it is the service of instincts, or the process of progressive motion in the process of Education.

Then come the matrix-culture inversions of the system, brought to the system of individual's stereotypes, which are the instrument for serving closed corporations, developing behavior matrixes, making a person, in fact, a slave, thoughtlessly serving their interests.

It is impossible to be an absolute mentor in this matter as each person has his own way. However, a separate case is worth considering. Nothing distances the final artifact of self-development in the form of Consciousness as alcohol and other drugs. But it is also something very far from understanding as the fact of refusal itself lays a challenge at person's feet – to use or not to use: that is the question. It is very often that a person leaves this world with these thoughts, and as often as not intoxicated by datura. Cultural matrix influences informationally

and toughly engrains these behavior and consuming algorithms since early childhood, leaving the child, in the long run, all alone with its predilections. However, it is possible to refuse, and it is worth it.

The control system sets its interfaces in such a way so that it can generate structureless control over heaps of people, playing the key strings of their psyche. In general, when you get down to it, the methods are not the sharpest knife in the drawer, but they are sharpened by time controlling stamps, flowing in one bed. The skills are sharpened in marketing, "selling" behavior matrixes to society that shall never realize that all of this is just a product aimed at control, i.e. solving a problem of its behavior predictability.

The purpose of the system is to close the hidden worldview codes on the lower human interfaces of psyche in order to implement the mechanism of external informational background circulation through its contours. One of the tasks is to exclude the possibility of changing the direction of informational flow circulation. Figuratively speaking, we can imagine human material dipped into informational environment with a predetermined background. Each element of such system should let the informational background through its psyche without any delays, and export it back in order to feed the surroundings with worldview codes. This is how the most stable system looks like.

Pure conscious for such a system is an absolute evil. Being a tune fork with nature oscillations, conscious, which is in the process of gem-cutting, is an internal filter sorting the information from the external environment, analyzing and understanding it, which is already a failure of inner contours of the control system operation.

Having got to the bottom of psyche a little, let's segue to consciousness as an objective entity of any materia.

Any Materia has Consciousness

The thought coming from consciousness, which has finished up gem-cutting, can be a generator of a complex torsional field[2] of a sufficient force to influence external torsional fields of physical objects, performing energy-informational impact. The thing is that torsional fields are an external projection of "mental activity" of conscious. This word phrase is given in quotation marks as, if we consider the fact that any materia has consciousness, then there is a question: what kind of thought can a chair have? However, if we have a torsional field, we have a thought. The "thought" of a chair compared to humans conscious thought has a lower organization, and, obviously, rotates in a sole frequency band. Can the "thought" of a chair be controlled? If we try, we can find the answer at our ancestors, who treated each thing as a living object not because of the polytheism, but because of quite different world understanding, based on comprehending the laws of nature.

We don't have to go far to find examples. One has only to think about how our conscious in childhood was influenced by the outside, when interacting with one or another means, from

---

2   'A Theory of Physical Vacuum' by G. I. Shipov.

time to time, throwing us, depending on the situation, either into mortal dread or into sweet childish unrestraint. Parent's angry look was enough to feel like a fish out of water for some time.

In this case, we shall define the contours of such child's reactions. First of all, a child is pure from all the worldviews, and everything surrounding it is an energy-informational background of a new, unknown world. A child does not have duly will to overwhelm the external energetic impacts, and it is a kind of sponge, which is projected with all the energy-informational background of the objective reality. The protection from the influence is either a biological field of a parent, or a biological field of a grandee adult, in the absence of which, a child falls into panic, and a foreign, aggressive environment begins to drive the child crazy.

Can such contours be laid on an adult? Certainly, as this algorithm is a part of a hidden society control system, and the per cent of such influences, at sampling from the fids of control methods, is very high. The difference is just that the contrast of a child's reactions is more obvious as it is somewhat a pure creation, whose conscious is in another frequency band. A person reacts on the external energy-informational influence in an automatic mode, and quite often out of emotions, although sometimes, on winning big, falls into the state of light euphoria, but just until realizing his being a hostage of circumstances.

It should be noted that the elements of influence on a parent often do not have the same effect on a child as the reaction mechanisms of a parent have not been projected on child's psyche yet. Although, every such parent's run "in an autopilot mode" is taken by a child at face value, which doesn't require deep understanding. Thus and so, matrix behavior algorithms are projected on the psyche of new generations without any problems, becoming a part of their habitual realities. It is one of the mechanisms of behavior matrix distribution from generation to generation, secretly serving powerful corporations.

We should elaborate the phenomenon of consciousness. Strange as it may seem, the process of conscious interaction with the physical world is an analogy of technosphere development, which will further be described in detail.

Consciousness is in Another Dimension

To reflect on this simple hypothesis, we need to understand what a dimension of the genesis is.

The supporting element of our external physical world and of all the multidimensions of the objective world is an ideal point. It is the main material to build a perceptible physical world and a transaction channel to that different dimension. Geometrically, a point is a one-dimensional object. If we place it in the space field and draw half-lines to any of the sides on the plane, we will have a two-dimensional object. We know from Geometry, that any object displayed on the plane is defined about axes X and Y in space.

To define a three-dimensional object in space, these XY axes are not enough as it is additionally necessary to draw another Z axis perpendicular to space field. This is the only approach in Geometry allowing measuring any dimensional body. This approach is sufficient enough to study our whole **visible** physical world, and, in general, the official science does so, once in a while modestly concluding that there are other dimensions of our reality, as it is difficult to explain many physical phenomena without understanding this fact.

We are not burdened by the science "degrees of devotion"; therefore we can calmly adopt this approach as we can easily explain the phenomenon of consciousness with it.

Let's imagine that a point is both a transaction to another dimension and a constructional supporting element to build a whole visible three-dimensional world. Then, at the first stage, we just need to assume that conscious is right there – in another dimension, which is a sort of reflection of the external world, – as to individually understand this presumption further. There is only one difference: there's nothing else except our conscious in the dimension where our conscious is, as there is only a Unified Consciousness of the objective reality and our conscious is its **integral** part. Considering that any materia has conscious, the conscious of any materia is a part of unified and common conscious in general.

In this sense, psyche is an external mechanism for conscious interaction with dense matter through the senses of the bearer. Hence, psyche, in many ways, is a generator of noises, projected to conscious, blocking pure conscious activities.

The understanding of this is the main mechanism of interpreting hidden interfaces of psyche, lurking in the **closed** source code systems, which are the instrument in the "chosen ones'" hands. As a rule, on having realized that, life begins to be more interesting.

In fact, in this sense, conscious is a source of intuition. Intuition, in this case, is a generalized concept of multilevel system of transceiver. Initially, intuition may be described as some conscious push, generating further thinking activity. An important point is which direction this thinking activity is going, and which psyche levels are involved. Intuition is a signal of another dimension. Human body senses, on the other hand, interact with psyche. At a later stage, when interpreting these simple truths, a person can come to a conclusion that the notion of intuition is just a shell of a complex transceiver system.

There are no notions of space and time at the level of conscious as another dimension interconnects to all the space and time of the external visible world. Thus, the world of three-dimensional forms is an extensional point of space and time, which is influenced from the outside by the general conscious of the objective reality, concentrated in one overall point. This construction is quite difficult to describe. In its general sense and more simply it can be described as follows: every point of space and time is a transaction to another dimension, which is a whole one, controlling the external world of three-dimensional forms. Every point is a

source of torsion field, sending energy and information, forming a usual matrix with its chemicophysical laws[3].

'In terms of time all the universe has a size of a dot'
Statement by N.A. Kozyrev at the symposium in Byurakan, 1976

Consciences Interaction

There is a great expression in the Russian language: "put one's soul into smth". It is one of the proofs that we have lost a lot, or somebody intentionally took it out of our field of view. Life Russian is staying a carrier of a serious layer of information, often giving answers to many questions.

Usually this expression is applied to art professions, where in the frames of the same project one can achieve absolutely different results regarding visual perception of the final result by observers, even though the instruments will prove absolute similarity.[4] In this case, the attention of the creator to the details of the project will play a key role. The more carefully we think over each detail, the more our conscious controls the conscious of this detail, i.e. it polarizes its fields within the energy of our field contours. If a pure conscious is solving this problem, then the effect will attract the outside looks of the result observers.

It explains the hypnotic effect of painters' pictures, when, it should seem, a simple blot on the canvas makes a visitor stop and join the process of understanding the painter's idea. In this case, there is a bunch of factors influencing the result. It is mainly the size of the canvas which was energized by the painter over time. In respect to the infinity of the Universe, this canvas is an endlessly small material point of space, into which the creator has put a part of his soul. If he would just spend his time staring at the empty canvas, carefully drawing the details in his mind and finally would demonstrate it, then probably he wouldn't obtain less result. In this case, the combination of color forms on the canvas is lateral but by no means unimportant.

Remember Steve Jobs and his love for detail, and also his hate for alcohol and his engagement with certain eating habits. If we correlate everything appropriately, then we can conclude that marketing, in contravention of Apple, is nothing else but pure psychophysics. Few people say that the founder of the company created a technological cult, in the first place. In order to be convinced of that, one need only to remember the screams of once rejoicing throng because of new marketing moves of Steve.

As for the hypersusceptibility to the external changes of the object, it should be specifically extended. As to read the external changes of the distant object, one should have an

---

3   If we assume that we live in a simulation, then its functioning principle can be based on the physical phenomenon, when the realization of the objective physical reality is formed by the inconceivable generator, concentrated on the "great spaces" of other dimensions contrary to computer simulations, based on binary transistor logic. Our world is usual only to the extent of the things and nature phenomena, which we have been used to since childhood and with which we interact by our senses. At this the "reality" of this genesis is quite tenuous as we are limited in its perception.

4   We shall specify it for those Associate Professors who cannot "measure" another dimension: the ultimate measure of another dimension is a human himself, as he naturally has a multilevel mechanism to measure all the things.

idea of its energy-informational layers. Simply speaking, at the initial stage, one should establish a system of direct and inverse communications, and then, during a certain period of time, be in contact with it. Such contact will have signs of field interconnection of two objects, consequently, together with the information exchange, there will be a synchronization of consciences.

Any examples are always plain to see. As simple example is a child and a mother. The mother does not only give the child the rules of interconnection with the outer world, but she has also carried him in her womb. Thus, the child is a part of mother's conscious, moreover, he derives his mother's informational background, and, to some degree, is distantly controlled by the mother until he gets a certain freedom of will.

The union of two hearts of a man and a woman works in the same way. Eventually, they confess to family relationship between them.

Subconscious

If we follow the accepted analogy that person's psyche is some kind of nugget, on gem-cutting which we get access to pure conscious, then subconscious, or non-conscious levels of psyche, is everything that is hidden behind the unprocessed face. In a general sense, the process of gem-cutting can be characterized in the following way: conscious is everything that has already opened during the gem-cutting, and non-conscious is everything to be discovered during the process of self-development.

Manifestations of the psyche non-conscious level pulsations can be characterized with all the known psychological differences, such as sense of justice, self reverence, conscience, morality, love and so on.

Conscious, as a strong factor of Creation hiding inside the noise elements of psyche, and being, in this case, subconscious, has a tight connection to the Design of the supernal reality and can be a generator of misguided (in terms of control system) actions. This kind of behavior is marked by Lev Gumilev as passionate, and people who make these misguided actions are marked as passionarians. Passionarians, in this case, are a direct proof of such raw power of all the non-conscious. The only problem is that not all the passionarity is absolute good, and the control system, based on certain and highest knowledge, relative to all of the behavior matrixes, has learnt to control this passionarity factor. Moreover, passionarity is in some way considered a system as a key mechanism of transaction to a new level of society control, and, consequently, self-control of society itself.

The thing is that at powerful impulses of the non-conscious levels of psyche, nobody has canceled the noises of matrix stamps, that is why actions of these elements can drop out of universal behavioral norms and permissiveness, shaping into some kind of natural calamity, especially when it comes to the concentration of passionate elements at some abstract point of the informational space and time, which may result in controlled revolutions and other.

Powerful pulsations of non-conscious levels of psyche, which encourage certain actions, have a destructive power if not duly used. In a general sense, such behavior can be characterized as energy without a vector[5]. The processes of self-destruction are most often seen in the society with a high-degree concentration of passionate elements, without proper development ideology. Alcohol, in this case, is a sort of a solvent for human biochemical reactions, caused by passionate impulses from the non-conscious levels of psyche.

If we consider the concentration of consciences of the objective reality in that[6] another dimension, and take into account that this concentration is a hierarchic sequence in terms of incoming information control, then the analogy to psyche as a nugget is the best. The Maker's Conscious[7] at this analogy has the highest and absolute cut. The Maker has reached the control of all the information flow of the entire universe. The Maker's conscious is the source of one and absolute Design, and the Maker is not burdened by psyche and has the Absolute Mind.

---

[5] The expression was used by a satirist and a public man M. Zadornov. In this case, the given expression is the most accurate.

[6] Or in this – it depends on where our attention during mental, intellectual and spiritual activities is concentrated.

[7] Here and elsewhere the Maker and God are philosophy categories, describing all the unknowable in general.

Collective Psyche

Note that everything in the Universe exists within the eternal rotation, i.e. if we consider that a thought is rotation itself and a source of external torsion fields, then the Universe in its endless motion, in this general case, functions within the one Design. This is a key point in a consistent pattern of matrix discharges, which we are to work out partially in this chapter.

The topic of collective psyche is quite complex, and indeed, the key points of this topic are a closed book. Little is written about it if any at all. It is not so easy to understand this material, especially if there is no balanced system of direct and backward communications with the environment under research, and an individual doesn't take part in forming the matrix of possible states, and, consequently, doesn't have basic knowledge of how information works, settling on the contours of collective non-conscious.

We made an attempt to understand that an individual enters a self-control mode the moment he begins to control personal psyche interfaces through his worldview. If we put this model onto collective psyche, then the subjective collective environment, controlling the informational flows inside its contours, is nothing but a network structure, generating external structureless control[8]. An unstable condition of a network structure can be caused by a subject's not understanding the possibility of self-interfaces control and his direct involvement in the network structure.

Spatial Synchronization

Following the theory of physical vacuum, torsion fields, in contrast with electromagnetic, attract the similar and push away the opposite. Consequently, to synchronize space, we need a system of such configuration, due to which its elements will have the least frequency diversity in the process of interaction with informational background, i.e. stability in behavior predictability in a cross-section of society should have the highest coefficient.

The methods of solving this problem are processed within the construction of generation system of matrix informational background. At stable, within the statistical accuracy, unified objectives definition of society – society is a stable, reflexive organism. At this, the degree of free will exercised by each of the elements of such organism goes down with the increase of the activity of a wider and wider group of persons. If we indicate such behavior on the graph, we will see an avalanche jump of the curve upwards, at this the beginning of the curve rising within the trend will be a target-driven excitation of matrix informational background by control system structures.

If one or another element is unable to understand the algorithm of its behavior within the general crowd behavior and to define the aims of the external control system within this control influence, then the element is synchronized with the contours of such collective psyche manifestation, showing activity within the frames preplanned by the system.

---

8   Brief analysis of network structures is in Appendix.

Particularly vibrant manifestations of collective psyche are seen when the system sets the goal of fastest result. Special cases look in the following way: when people gobble up the basic necessities, or under the power of fears of the upcoming pandemic they line up for vaccination and so on. Usually, quite rarely, anybody is able to give a substantiated answer to the question of such behavior reasons, and often the answers come down to simple bits and pieces of collective non-conscious: "everybody went, and I went".

In everyday life, the manifestations of collective psyche are actually the general cross-section of masses behavior of sluggish avolition within the given by the system freedom of will.

On this basis it can be concluded that the system, in the first place, sets a goal to control the collective non-conscious of the crowd instead of controlling an individual, and in case of special degree of understanding these or those behavior algorithms by some individual, the system solves the problem of deactivation of such individual through the crowd activeness, directing its dissatisfaction to his activities. Thus, the crowd with its collective psyche is nothing else but a human material, whose energy movement direction is able to change at strictly set control.

Collective Non-Conscious and Symbolism

Within the system with **closed** sources, when the corporate logic is based on the principles of commercial secrets, obviously, there should be a strictly defined information system. Broadcast in public or under the surrender of the "secret documents" on the worked-out strategy of further development is out of secrecy logic, and the roots of the control system go way to pre-biblical times, that is why a mechanism of symbolism, concentrated within the matrix informational background, was sharpened during the centuries.

The echoes of such manifestations are reflected on culture items, which, in their turn, are a kind of projection of the collective non-conscious. If we look at the museum exhibits, then symbolism is based upon biblical images, or on the images of the ancient Greece and Rome, and the images of Egypt Civilization times. The essence of mythology is built in a symbolic form, where every symbol or a set of mythological actions, may enclose a whole system of social phenomena of society.

Considering the algorithm of object "thought" control and the possibility to project mind-images of the painter or sculptor to the objects of his oeuvre, we can conclude that these mind-images are projected on the non-conscious levels of psyche of any observer, even the one, who, passing by the exhibit, hasn't stopped to understand the idea of the painter. Everything in our world functions within the energy-informational exchange and for this reason, everything is based on cause-and-effect, therefore such concentrations of historical culture in items of culture entirely represent those hidden encrypted codes of worldview, which are a product of the control system.

The set of factors of collective non-conscious and symbolism, altogether are the reason for matrix discharges.

Matrix Discharges

The collective non-conscious, in this case, is an absolute container for encrypted information, which, considering the fact that collective psyche is nothing else but the generator of a torsion field only with a stronger organization, when effected by controlling conscious, can matrixly show itself, relaxing on the external physical objects, concentrated spatially and in time at some point, symbolizing at that moment of time eventivity or a set of "random" images – a forthcoming set of algorithmic matrix events.[9] Simply speaking, such egregorial-matrix discharges are filled with numerical measure of some statistical predetermination and symbolics. The controlled subjects' goal-setting can be read from the collective non-conscious through these discharges.

If we consider the fact that a soviet astrophysicist N.A. Kozyrev did not have the generally accepted notional base during his researches, and all his researches of time can be considered researches in the field of physical vacuum regardless of time, then his following statement generally describes the subject under consideration:

"Time continuum is a universe filling materia in the state of boson condensate, touching which leads to its throughout excitation".

It is obvious that if we consider any excited state of physical vacuum as a cause, then matrix discharges are its consequence, drawing a set of collective symbols at space-and-time point of each specific discharge, showing eventivity.

Judging from the fact that our civilization is at the stage, when society shows signs of the worldview based on the **open**-source system, the egregorial-matrix discharges begin to form new shapes, at discharges of which there is a new cross-section of symbolics, based on other cultural codes and on other numerical measure. There may also be shifting processes on the demounting of one or another structure or the authority system within the control systems. That is why these processes are always accompanied by confrontation at the levels of adaptive control, which may also be a reason for matrix discharges.

---

9   Examples:

•   Sulfur smell in Moscow's air

•   Costa Concordia shipwreck

•   and so on.

Society

We have already partially addressed the question of not all the freedom of will being free, and if we follow a special logic, then **freedom is defined by the degree of meaningfulness of actions**. This will be enlightened in this chapter in detail.

Any person is a part of society. It is always more interesting to consider this from this perspective. We have already partially touched upon the matrix reflection on individual's psyche. Let's try to stop at it in detail.

A person in and of itself is a biological projection of nature matrix. When interacting with society, cultural matrix is project on person's psyche, which allows building the chains of interaction with society. The control system builds structures in such a way, so that a person could in the fastest way and with the highest stability coefficient merge into culture matrix to keep on translating its main cultural codes. Thus, the control system sees the bulk of people as retranslators of behavior algorithmic. Control structures, their hierarchy and authority system are being built according to these needs.

The control system, as an objective reality, is a part of stereotype system of society, some contours of which can be state machinery in its whole unity. The real power and its universal cause are always closed for individual's psyche interfaces. Its indicator is mass behavior both at the higher order of hierarchy and at the lower. **In other words, the reflection of real power is our worldview**. It may be either more or less integrated into our psyche for the purpose of secret control of our behavior. At these settings, the control system can just selectively or widely influence the informational background of society to reach the necessary behavior in its cross-section.

State or visible control structures are just a kind of form, translating the controlling information flows, and the elements of these structures are just the same retranslators, adapting to goal-setting of the real power, reactionally responding external controlling impacts. Thus, at destruction of imaginary statehood, only the external decoration shell is being demounted, although the real power itself stays where it was and keeps controlling society processes.

The key aspect defining the stability of such system in time is a difference in the level of understanding between the real representatives of the real control system and their elements under control. The objective main factor in this matter is the difference in the worldview. The worldview of the regulators, aimed at control in all directions, cannot be comparable to the zipped demo-version, projected at collective psyche of society.

From this thought perspective, there are some lines of the following logical piece – that is, education. If freedom is defined by the degree of meaningfulness of actions, then **the degree of individual's distant control beyond his conscious is inversely related to his freedom**.

In order to get to the matter of education, we will start with family as of primary source of person formation.

Family

If we consider this society phenomenon from philosophy point of view, then we can come to conclusion that it has a sacral nature. To consider this phenomenon, we need to start from afar, from the very origins of life.

When considering this matter, we will fully touch upon the system of goal-setting concerning family. The system, as in any sacral matter, has set its own mechanisms in family, considering this institution somewhat a driving mechanism, motivating to serve the system interest by each family member. We will again see that everything is premised on a worldview and cultural matrix codes.

This topic is quite complex, and if a person has reached a certain level of self-control outside family relationships, then, when creating a family, he may meet new challenges, some of which can stump him in the process of self-development.

Few people have thought that in order to get a good job one needs to graduate school and university; and to try to start a family one needs nothing but the consent of the parties, and then come what may. Maybe, it is the reason for divorces and unstable unions. Let's figure that out.

Life

If we consider life from the control system's point of view, then we can come to conclusion that this matter has an obviously materialistic cult. Solving the problem of behavior predictability, we need to shut society attention on the material manifestations of life and exclude any understanding of the fact that Life in its diversity is an endless motion and transformation into Spirit embodiment; and those who operate these categories need to be raised to the rank of fringe groups and lumpens. The system provides stability due to the system of motivation within the material values. Any signs of person's Spirit education are seen as signs of delusion and worldview nearsightedness within scientific and philosophical mainstreams.

Let's continue to base upon the accepted analogy of psyche with a nugget, which is, at bottom, a transfer to another dimension, where our conscious is covered with the unprocessed roche of our non-conscious. This accepted analogy is nothing but a filtering mechanism of our accepted worldview, making the thought to concentrate at a single point and directing the outside looks into the world of light and shade and physical impulses. It is the way we become a part of another dimension, getting closer to consciousness and, consequently, we get rationality, excluding the manifestations of psyche activity coming from the physical body interfaces.

At this approach, the external manifestations of the matrix take the rank of more sensible categories, representing external goal-setting towards it.

Consciousness in its highest performance is the projection of the Spirit, performing the function of the bridge of physical manifestations and light and shade impulses. Consequently, the whole visible world is nothing but the Spirit manifestation. The reason for all the interaction of this diversity of forms is a unified Design, which is a denial of the freedom of choice towards the fact of its existence. The freedom of choice spreads through the channels of the Creation initial causes out of all the multiverse of the objective reality, concentrating the highest degree of the freedom of choice on the projection of people behavior, giving an ability to get the freedom of will.

Consciousness, being the highest realization of psyche, has its own information-algorithmic manifestations. Psyche activity when interacting with the body has a sort of analogical manifestations, only of a lower organization, exciting the rough strings of the lowest layers of all the information-algorithmic chains of interfaces.

If conscious is an integral part of the materia in the solid world and has its spatial localization in another dimension, then where does the conscious go when the materia fades? Is there a fading of materia at all or are we just facing the transfer of one substance state into another?

Let's leave this question for adoption to the reader for his further searches. There are many sources, one way or another touching upon this matter. We personally have adopted the notion that the human's body is nothing but a "suit" which we throw off when it is worn out. [10] It is difficult to measure life after "death". We can only make some conclusions based on certain observations from life. To do so we should ask ourselves a set of questions:

Why, when born, some children have a higher potential, which can be marked as nothing else but the presence of some kind of memory of the processes, which haven't taken place since they were born? Why the potential of some people development is a lot higher than the potential of development of the rest people who are a lot older?

We can logically find the answers if we bring into the considered model of the notion – experience. The experience of former lives, where the genetic "suit" is being sewed according to the size of each person entering the embodiment. Life in a body gives the freedom of choice to develop in any directions. At this, you can only bring from one life to another the experience and accumulated potential in the process of becoming Homo sapiens.

A person is a kind of information container. Life gives an opportunity to fill the missing space of the container, dipping us in one or another environment when we are born, and it projects on us a kind of specter of predeterminacy underpinned by the position of the planets at the moment of our birth,[11] genetic code and cultural matrix. Due to this, every person has a

---

10   It should be specified that this representation is taken not at face value but is a result of understanding Life within the interaction with its manifestations, and it is also some knowledge system, worked out due to processing of information, coming through the system of direct and back communications and at interaction with the environment. Life, in this

projected matrix of possible states of development, which is quite a predetermined area of condonation.[12]

If a person's memory in the shown form is kept as images, taken from the everyday interaction with the surrounding world, then the pure conscious has a holographic structure, the memory of which is stored in quite an "encrypted" form towards the brain memory. A person's psyche when interacting with conscious decodes the information coming from conscious, when interacting with the dimensions of the genesis to process it in the usual for a person way for further operation and its usage.

When interacting with the surrounding world through the person's embodiment, conscious is structured and filled with new structures of the hologram, joining through holograms with hierarchy of genesis conscious, realizing in integrity.

Thus, for conscious memory interaction, a person needs to accumulate a certain layer of information, scooped out from the daily life to build a chain of analogies with the conscious memory and for its proper operation. Moreover, humankind needs a notional and terminological base so that each person could easily decode the memory of personal conscious, expressing it in his world-understanding to reproduce the new informational modules, i.e. to create a new product of intellectual art.

At this perspective, the control system, with all its mechanisms of influence of people's psyche, is a system which is a motivating factor to think about the reasons a person exists. Since if we move within the algorithmic manifestations of the matrix, then there are many questions. The problem is that some people look for the answers and others bear it, mindlessly reproducing the behavioral templates from generation to generation.

If we describe the behavior of the system more specifically basing on the notion of hologram conscious, then we can draw a following picture. If we consider the fact that everything in our world exists within the unified Design, which is a derivative of a whole Conscious of the Higher reality, and a person, in his universal cause, should represent an integral part of this Design and be the vicarious ruler of God on earth, then the control system needed, at a certain stage of system construction, to create **a foreign conscious of the parallel reality**, controlled not by the unified Design but by the controlling conscious of the control system, projected through the representatives of the higher control system of public behavior.

---

case, is considered a system being researched and a system into which the researcher himself is dipped. His task is to correctly build a closed system through the interfaces of his own psyche.

11   There is a theory in astrology concerning the retrograde planets (planet movement in the opposite direction of its orbits towards the Earth movement), if a person has them in his radical map (horoscope), he gets a chance to work out the mistakes of his previous embodiments. Often, according to the concentration of the data of the retrograde planets one can see the trouble spots, which walk into life most often.

12   The understanding of this problem makes us conclude that the system of the biblical Ten Commandments is a drop in the sea and in many aspects it is a short and general list. Condonation system is a complex system of cause-and-effect connections and every person goes along one's way of filling the strictly defined tanks.

If we take this into consideration within the given picture, then it is obvious that nature affects people one way or another through convulsions not anyhow and out of the clear blue sky, but due to the fact that the created artificial and foreign conscious functions against the unified Design and the overall frequency ranges of rotation of both consciousnesses are in a kind of struggle. Considering the fact that the Universe energies are a lot more powerful than the energies generated by the mankind inverse behavior, it is obvious that mankind has not yet crossed the line of the overall connivance and nature still acts selectively, showing those same natural discharges towards the matrix. If we go further, we can arrive to a conclusion that the ability of our ancestors to "call out to the wind" is an objective entity and only in the case if there is a sense of freedom of choice and will, which will be described in detail in the following chapter.

For these reasons, we may ask ourselves a question: why the control system, being a source of such behavior, still actively exists and reproduces obscurantism but the manifestations of nature convulsions pass it by.

The answer is simple: the key task of the control processes comes to hiding the keys of knowledge, and obscurantism source is people themselves, and within the upper floors of power there may be quite an acceptable for the Creation worldview within the unified Design. As for the marked elements in the control system structure, they periodically and quite actively renew within the top coups and the revolutions from the below due to the fact that their general characteristics slightly differ from the characteristics of the deprived gutter. [13]

Child and Parents

In the East, the embodiment starts at the moment of conception; but Ancient Slavs consider it from the moment the child wishes. Parents created an image of their future child through their wish, setting his characteristics thoroughly. The conception was close to a sacred act, when parents' attention focused on the pulsations of the Universe in the Conscious dimension.

The process of conscious focusing on a physical body of a child doesn't happen at the moment of conception. A sperm cell, in this case, is a genetic core of the future physical body of a child. At the initial stage of development, a child is a relatively simplest program aimed at physical development with predetermined objective characteristics.

At the initial stage of development, an infant is covered with his uncontrolled body. This body has a pure memory not loaded with information on the processes from the physical world. The only thing that is somehow developed is an "awakening" conscious with a certain level of maturity saved during the previous embodiments, but due to the fact that the external manifestations of the matrix come to the first place for a child, and children begin to suck in the eventivity, dipping their attention into the physical solid world, they, not knowing it themselves, actively apart from conscious in its highest performance.

---

13   The differences are just in the level of enlightenment.

Until a certain age, a child sees the world as a complex of unconnected light and shadow impulses.[14] Interconnections appear only due to conscious activities within the non-conscious pulsations, which can be characterized as manifestations of conscience and morality flowing in overall understanding process.

The only source, projecting matrix manifestations on the fresh psyche of a child at this stage of development, is his parents. If, at the initial stage, a child sucks in only the emotional background of its parents, projecting further signs of emotional behavior on its psyche, and the task of its parents is formed in a set of actions, such as changing a diaper, feeding, washing, sing a song and playing, – then further on, when they can get the system of direct and back connections up and running, parents give the grounding of what is good and bad. At that, the main algorithms of behavior are projected not from words but from the examples of behavior of their parents.

The perception of an infant, and later on a growing child, as a sort of personality with quite a definite set of presaved characteristics, makes a child see its parent in a different, more solid mode. A certain maturity of conscious will always give a proper response to an understanding adult. It is due to this mechanism that a quality connection between parents and their child is settled. If, in addition, a parent will listen to philosophical or other logical conclusions of his child since childhood, and clearly encourage a child for the right line of thinking, and motivate it to independent thought creativity, and follow its personally developed recommendations, then the interaction will flow in an intense mode. Otherwise, child's conscious will reject any adult, denying its quite definite maturity, in case there is such.

A child my look silly only if it is unable to express its thoughts, at this a parent may himself provoke the misbehavior due to personal reflective behavior.

Man and Woman

Strange as it may seem, but our ancestors could even "order" the gender of a child, although biologically, sexual characters show up only at a certain stage of embryo development in the womb.[15]

Certain psychological differences between men and women are built up through sexual characteristics. We will not touch upon this topic, a lot is written about it. Our task is to reveal the secret codes of control. However, let's briefly define the borders of the control system – to be specific – let's say the system uses these differences to build a stable control mechanism and a family is, in this case, a central element of the system, which apparently loses its importance here, entirely following the way of self-destruction within the externally set algorithms.

---

14   The control system works flat out to make this external matrix background stable until the late aging. The set of unconnected beautiful pictures is much more acceptable for the outside control then a whole view of the world.

15   Nine weeks after the fertilization, 11 maieutic weeks (after the first day of the latest period).

The control system represents man and woman through various philosophies as two elements on different sides of the scales. Thus, a certain confrontation of sides is secretly being laid, ideally in a balanced mode, yet, each of the sides within the analogy can claim the increase of its weigh within such relationships. We will try to escape the power of this model and lay the principles of the synthesis between the two metaphysical elements, where the highest achievement within such interaction is Love. The stream of our thoughts will lead us to the understanding that love is not an emotional feeling which is a result of a rencounter or of communication of two opposite bodies, but the Highest achievement of consciousnesses in the process of mutual creativity.

Before we begin, we need to make a caveat. Superior cases of sex interactions within the control system are discussed below. We should also admit that the model under consideration is an ideal model within the system, where men or women have no affections to different forms of self-destruction, like official or "forbidden" drugs, when both individuals lose the character of not just humans, but also as of animals.[16]

* * *

Genetically it happened so, that women are instinctively bound to a child and are tooled for serving its immediate needs and offering a descent spot under the Sun, so they choose men of those suitors who are ready to give that spot. In this key, woman's psyche functions in higher frequency ranges than man's, i.e. woman's planning range is narrower than man's.

Men, unlike women, have a habit of mind aimed at solving problems of a more strategic nature. Consequently, the planning range is wider. Nevertheless, genetically, men's psyche is bound to women's genital organ and one way or another solves the problem of getting a free access to it. In this case it is a genetic mechanism of men, realizing the function of procreation.

At such chain of affections in key elements of a family, the control system only needs to shut certain informational flows of the matrix background to excite such mechanisms in parties' psyche, i.e. so that the characters served the interest of the system automatically without any second thought. [17] At such approach, the control system realizes the mechanism providing instinct service, when all the creative energy is channelized through the material achievement show in the name of immediate pleasures and following losses, while the general family planning range is narrowing, due to what a family loses the connection with the reality and its resources are spent in vain.

Such functionality automatically faces women with a choice between following the given behavior logic or not, i.e. realizing the interaction with man in the mode "I'll give or won't" or "if I give, then if…". [18] The main principle of matriarchal society construction is being realized this

---

16   Total alcoholism of male population makes mothers take the role of both members of the family, realizing the echoes of national folklore: 'I'm a horse and I'm an ox – I'm both sexes – so it goes'.

17   Considering such patterns, many answers to questions begin to effloresce at the analysis of external, informational matrix background, within which sex is being cultivated and the notions of love and respect to the opposite gender are taken out of sight, exciting the principles of eternal confrontation in minds.

way, when the prominent representatives of males from the authority system are controlled by their wives and lovers.

The main task of a man who wants to non-consciously get free from the control, and at this kind of woman's behavior is not to set the instincts free, and this way get rid of the power of "vaginocracy", or start pouring alcohol on it, or find a decent replacement. Moreover, the end of the 20th century was marked by the appearance of feminism movement. On the basis of its activity European countries legislation set the "gender equality". Such shifts in society led to the establishment of relationships in family on the principles of joint household, just as business activities with a general further capital, when the legislation behind each of the bilateral actions encourages one or another family scene participant to different actions, being sure that state is always on his side, ready to give all that is needed to the most "unprotected" and weak side.

On the whole, if we consider such innovation in the construction structure of family relations, then we can come to conclusion that woman got a sort of freedom of actions towards man who is already under the power of "vaginocracy" due to the propaganda of "free sexual relationships", and the matriarchal principles have settled down legislatively. All of this additionally influenced the overall narrowing of the planning range of both society in general and the structure of the control system, particularly, having strengthened the quality of civilization turbulence.

Everything above was considered from the point of view of the collective psyche control system, denying the development of this society at a certain vector. Within the creation with **open** codes and at psyche movement towards conscious, the relations between men and women are presented differently.

Love

To control society steadily, it is necessary to provide the conditions at which society would never gain mind and would function in automatic response mode. One only needs to shut psyche interfaces to serve instincts, realizing the algorithms of the external behavior matrix, to do this.

However, the Creation has its unified Design and a person is given a chance to steadily move along the way to get the Mind, interpreting the many patterns. Our task is to define the contours of the design towards a man and a woman.

Everything in our world exists as an endless creative process aimed at realizing new forms of life. We have already defined that any substance is life, consequently, it is a result of the highest creativity.

Anyone, who one way or another met the creative process, knows that on having reached the preset result, there is a condition, when the flight of thought and the desire of new

---

18   It is not good or bad – it just is. Such behavior algorithms especially seen in large cities and metropolises, when women's psyche is under the influence of a wide specter of allurements, especially if they are possessed by female-representatives from the closest surroundings.

forms realization are born. Let's apply to these observations the following expression: the cognition of Love is achieved by means of creativity. Consequently, we can establish from this logic quite a neat logical chain.

With regard to the given logic, it will be obvious that God creates in the highest degree of Love, and Love is nothing but an area of the supernal reality, independent from our existence. As the interaction with the external surrounding world in the creativity mode within the Unified Design goes, a person can access it by dipping into it with his own conscious, and he can broadcast the codes of Love into the surrounding world of earthy realias.[19]

Man and woman in this metaphysical process are synthesizing components, at the interaction of which there is a synthesizer of the creative potential of one party with another. If we look at the external results of human creativity, we will see that man in this process is a doer whose interfaces are most involved in the process of creativity. Woman gives her man the necessary creative energy and in the creative process they both get the access to Love, in which God creates himself. Two people due to such access are the conductors of his Will.

At this logic two people are not a counterbalance on the scales of matrix manifestations, but a whole one, whose synthesis aim is to be the conductors of God's Will and to broadcast the Love codes into the World of earthy realias.

Their task is not to suppress the will of each other but to understand that only due to the interconnection of both consciousnesses there will be an external result of their mutual creativity, and Love is the greatest achievement at this interconnection.

Hence, when two people meet, they are attracted to each other not due to love from first sight but due to the similarity of metaphysical peculiarities of each other, at the synthesis of which it is possible to enrich the creative potential and reach the Highest Love within the highest creative process.

A child, in the mode of interconnection with Love, shedding from its parents, and being itself a derivative of the Highest Love, grows up a lot faster, and many matrix manifestations, reflected on his psyche activity, pass him by. Each such child can open its potential much earlier and posses the access to Conscious a lot easier, and secure its interfaces when interconnecting with the surrounding world, especially, if this process will be accompanied by the acquisition of the worldview aimed at self-control.

---

19   Those who take different kinds of datura, do not understand natural euphoria without any psychotropic substances, as it is often that success is poured with a shot or two of alcohol. To get the first feelings of pleasure developed by our brain, one needs to stay away from alcohol at least for two or three years, so that the brain neurons could restore, forming an integral chain.

The thing is that when taking datura, the brain is being destroyed, breaking the chains of interconnections of its neurons. That is why Love and Datura are two incompatible ideas. Following the considered events, the lowest signs of love, showing through the coarse roche of the non-conscious, are just animal instincts.

Education

Let's imagine the Creation as an absolute container of information and knowledge about ourselves, encrypted in the principles of its existence. Thus, we will target the objective contours of our movement.

As we have already seen, society is a controlled system of collective psyche, whose behavior algorithms are established through the informational background, coming from the mechanisms of structure and structureless control, then the control system solves the problem of defining the borders of world cognition. I.e., based on this logic, the initial patterns of behavior matrixes are scientifically established in educational institutions through the limitations of the access to the wealth of knowledge, which is possessed only by the representatives of the hidden higher control system.

Thus, on the one hand, there is the Creation with a wealth of information on itself, and on the other hand, the set limits of world cognition. Within the set system of the objective reality perception, – where a person is seen as a reactive mechanism, which due to certain abilities can broaden his range of external, processed by his psyche, objective factors, while getting the additional skills, – the borders of the world are narrowed and often taken to the extreme degree in the fields, on understanding of which the main and economic prominent activities are based. [20]

In the system with **open** codes, where the boundlessness is established into psyche by the principles of the worldview itself, the world is various and to the full extent incognoscible, **where each stage of movement on the stairs of research activity is a reason to reconsider the former, interpreted, objective phenomena**, which is the understanding that the World is not static and a person is not the crown of nature and can make mistakes. This boundless movement is the reflection of the fact that each researcher functions *not within the external system authorities, but within the control of own interfaces of psyche*, where **the purity of conscious and intuition** are key moving mechanisms at the stage of cognition of all the diversity of the Creation laws.

Any control system based on the principles of the commercial secret is a multilevel control system. On each "floor" there are borders of cognition, where at the transfer from one 'floor' to another, each contender go through an obligatory stage of initiation. The borders of freedom of choice and will are defined within the borders of world cognition. Each stage of ascenting the pyramid is accompanied by the confidentiality agreement. The actions of each such "careerist" when going through the hierarchy of structures, is controlled by the external punishment organs. The permissibility area is conditioned by the principles of crowd-"elite" society.

---

[20] Philosophy, psychology, social studies, economics, history, biology, genetics. There is no cognition methodology. The basic physical principles are cut while the theories, on the basis of which one can start building absolutely different principles of society construction, energetics and technological, fundamental base, are ready.

Here a key moment must be defined. Moving around the floors within the built by the control system structures has its limits. The higher power is always closed to let in any foreign elements. The reins of power are given within the knowledge passed from generation to generation.

Freedom of Choice and Will

Within the culture, a person has quite a definite strictly limited by the matrix freedom of choice. If consider a person as a biological being, then a person is a sort of development level towards other representatives of biological species. The culture matrix gives every individual its strictly definite area of the freedom of will. Due to it a person can show his will without biting another one in a conflict situation, he can avoid the animal passion as not to have sex with a representative of the opposite gender in public and so on.

The outstanding feature of a person among other biological species is his ability to learn and understand the world in all its diversity. During such education, there is one pattern: with the advancement of educational process, a person broadens his freedom of will, i.e. in the process of education a person has an ability to understand his own behavior within the preaccepted behavior matrix and at revealing false algorithms, show his will as not repeat the same in future.

As an example, we will take a child, who has already learnt to eat with flatware but still, not having realized that, eats with its hands.

If we look at this phenomena in a more general sense, we will see that the external visible world gives a person boundless freedom of choice. The borders of the allowable are defined by the cultural matrix of a person and the degree of understanding. **As the degree of his understanding broadens, he narrows the corridor of the freedom of choice and consequently broadens the corridor of the freedom of will**.

Thus, a person who has comprehended some things compared to others, cannot allow oneself one or another whim not because he sets himself some borders and is in a mode of intense inhibition, but because he has some understanding of the mechanisms of different whims and **easily** refuses to depasture in the fold of the illusions programmed by someone.

Consequently, the will is not a psychological quality, making us bite the bullet, but an easiness which allows looking at the world completely differently and, while broadening the degree of understanding, the will with a moderate simplicity allows doffing the husk of cultural-matrix manifestations, foreign to his process of education. In relation to the surrounding world, a person, endued with a certain freedom of will and within the Creation in general, becomes a bearer of some Power, which is the highest achievement of a person in the process of Education.

If we want to draw ourselves a picture of matrix borders, it will be enough to draw a square on a piece of paper. Within this square there are many stamped points. One of these points is an individual that is being researched, whose behavior is defined by the edges of the

square, and the behavior of other points within the square. The edges of the square are defined by us as external unknown phenomenon. We are not comprehended by the individual within his degree of understanding, as we are beyond the edges of this square and can change the configuration of these edges so that the individual never came to understand that we exist. Yet, each individual has a chance to comprehend the general behavior of the whole "square" system and try, while comprehending, to broaden its edges, thus and while broadening his degree of understanding, start becoming wise and regulate the process of own behavior not within the set by us algorithm, but by the process of own self-development and general comprehension.

The square edges, in this general case, are informational background of the matrix, broadcasted through the informational sources from the floors of the authority systems. An individual's behavior is programmed both by the background itself and by the behavior algorithm of all the points of the square within the codes, installed in the matrix informational background. [21] The informational background, as a rule, is strongly shifted to the relative vector of movement within the unified Design.

Higher Education?

Now we segue to the understanding of what education truly is.

When considering this matter, we need take into account the position of each person in space and time; at this the position is established by his worldview. We have revealed two types of logic of the analysis system construction and the perception of the objective reality construction – they are systems with **open** and **close** codes. After our general stream of thought we can reveal the contours of each of them.

In the case with the **close** code systems, a person positions himself as a part of cultural matrix and often, without thinking, takes its algorithms of general behavior. The matrix proactively writes down into its system of stereotypes the stamps of behavior and goal-setting. The system defines clear limits of good and evil, changing the configuration in different periods of the control system development. The control system has clearly marked the system of authorities, through which the key algorithms of the defining standards and rules are broadcasted.

The control system gives clear definitions of what are happiness, joy and success through the background informational contours of the culture matrix, motivating each element of the system to different actions. So, the borders of the freedom of choice and will within the

---

21   A great example is a set experiment with fleas steeped into a closed jar for three days. The only difference is that a flea is unable to comprehend its own behavior and broaden the area of the freedom of will, and a person has this peculiarity. https://www.youtube.com/watch?v=bOp3KopTYwg

Further on, when considering the question of technology development, we will come to conclusion that there are a lot more possibilities now to comprehend things, and most processes go on in the mode of continuous self-reflection. Algorithms of which were established in the former times, when there was a different technological pattern of life.

PASSIONARITY

control system are clearly expressed and, due to the inertialism of thinking of the main system product (worldview) bearers in general, are of no doubt.

In the case of the **open** code systems, a person, on the contrary, positions himself as a vicarious ruler of the Creation, the edges of which are incognoscible within the whole global historical process. A, being a bearer of such worldview, is always in the state of comprehension of the crowd behavior and his personal behavior in the environment of natural phenomena. During the comprehension process, each person is able to reveal the deep manifestations of his own non-conscious activity, bringing them to the level of conscious to henceforth learn to control himself and transfer to the mode of self-control. In such mode of interconnection with the outer and inner world, a person is a part of nature whose conscious is always able to synch with it. The authority system has no clearly defined boarders, each person is seen as a bearer of one or another worldview at one or another level of development and with one or another luggage of the **comprehended** experience.

The adherents of this approach to comprehension understand that the control system plays beyond the edge of good and evil due to a special degree of understanding and use these two notions as control instruments. Consequently, the control system can be considered not as absolute evil but as just the same inertial mechanism in all the system process assembly, from higher power to lower strata of inertial society. [22]

Consequently, within the **close** code systems, we can clearly define some edges and limits in the education process, depending on one or another degree of enlightenment. The limit is due to the fact of educational institutions, where within each of them, there is a system of cognition moderation from the teacher corps and the rectorate. Any signs of free thinking can be evaluated as the stupidity of a student and will be strictly stopped by the attestation system.

The worldview aimed at self-control is a different story. A person assimilates any information on his own, sensitively feeling the requirements of Life and following its signals, and understanding that it is the language of Life that is his main moderator and motivating factor towards different actions, and also a watching and punishing organ, making him break the false prejudices of his daily life. Intuition and methodology of cognition, being the main instruments of conscious, allow orientating in the gazillions of information, clearly revealing the key moments of the comprehended phenomenon. Education is an endless process, and only the Creator himself has a Higher Education.

---

22   In general, the control system core has deep roots, and we need to take into account that it is possible that initially and while mastering a certain knowledge system from the level of core, some attempts were made to send society into another direction, but due to the quality of society itself on the cusp of history, came to conclusion that it is at some point a useless thing to do, due to the simplified system of requirements of its main masses.

The caste of hierophants turned into a closed caste of knowledge bearers, blocking the access to their rows to the lower level and keeps its existence through present. Thus, we are at this state not because the control system functions in the mode of villainy, but because the overwhelming mass of people is inactive in its development and keeps grassing in the world of created and reproduced by somebody illusions, waiting for some "absolute miracle", which will fill the fridges with sausages, wine, and which will fill life with drunk joy, and education is seen as means of reaching such simple notions of delight.

Anyone, who got "higher education" within the control system and stopped in his educational process right after he got the diploma, loses education **as stops the process itself**, which is endless. Thus, the movement towards the Higher Education, as an abstract incomprehensible is a system failure and the system has successfully worked out the inversion of this process sending it in the direction of mastering a narrow specialization, which has its objective limits due to the incompleteness of the general knowledge system.

Let's connect the picture with previously revealed pattern. If we consider the fact that on broadening our degree of understanding we broaden the corridor of the freedom of will and actually narrow the corridor of the freedom of choice, we will come to conclusion that the Pantokrator has the highest Will, and due to this we can find an explanation to such expression: God's will cannot be overwilled. The more constant and stable the process of our education, the less reasons there are to worry about the fact that matrix manifestations will have the control over our will, giving a sort of corridor of the freedom of choice.

 Conscious, in the process of education within the general unified Design, is set, going up the hierarchy of nature and Cosmos conscious, and gives the bearer special qualities, promoting the energy projection into the external environment, and consequently, it is enough for this corridor of the freedom of will – the area of responsibility.

The responsibility area becomes the mechanism narrowing the area of connivance for the bearer of will. If a certain movement vector is running, then the movement backwards is also possible, but life situations make us reconsider our behavior before those, whose freedom of will is in its initial, for each considered individual, state.

If the responsibility area within the control system structures has clear edges, marked by corporation bylaw, law and constitution, then within the broadening of the freedom of will, the responsibility area is defined by the width of the comprehensible by conscious events in the process of interconnection with the Creation. In the second case, a person becomes an external, substantial reflection of God's Will.

' … yet the integration doesn't happen, at least at the interval of the last stage of the existence of modern positive science (about 400 years). Moreover, it may seem that

modern science and magic[23] (if we call a spade a spade) are some kind of "immiscible liquids" and cannot be mixed in principle.

It is obvious that a potential "Great unification" can give a lot both in practical and worldview aspects. Does a person need such a complex (requiring certain intellectual and spiritual efforts) image of the world? Can he do without it? Will he go along the way of degradation within "the society of consumption"? Only time will show. Otherwise, a Person must become a Person of Noosphere, and this is way too difficult, but necessary for his survival in principle...'

FAR NON-LOCAL INSTRUMENTAL INTERACTIONS IN FORMING THE CONCEPT OF "INFORMATION TELEPORTATION"

A.U. Smirnov[24]

Mind and Intelligence

The informational matrix with all its floors, motivation system and the system of knowledge supply is quite complex. Not every individual is able to freely orientate in all its background flow of information, especially during the development of new technologies. The control system made an attempt to develop a mechanism, defining the intelligence coefficient. The attempts failed as the priorities of the system are parallel to giving a chance to the floors to define what are intelligence and mind in their general sense. The reason for this is the matter addressed by us that the system gives the priority to the control over the psyche interfaces of society through the replicated worldview hidden codes. In order to define what is mind and intelligence, we need to give a systematic view on the process of psyche interconnection with the external informational background of the matrix and internal conscious impulses, what we actually did above.

Thus, from the point of view of the control system, intelligence is an ability of brain to solve non-standard tasks, without leaving the borders of saving the principles of system construction. Anyone, who is able to freely orientate in the informational background of the

---

23   Here the word 'magic' is expressed as a general notion of energy-information process character, which is not quite accurate in our view. Magic is a mechanics of interaction of conscious with the accompanying material objects, when a magician excites the fluctuations of initial vacuum materias (grand materias), feeding them with the energy of magic "instrumental" means at hand, as to reach the forecasted result. Quite often such techniques carry inside them dangerous for the surrounding energy-informational environment consequences, as not every person calling oneself a magician delves into the reasons and effects of such interactions, but act according to the described methods, which is followed by a chain of undesirable consequences, which are reflected onto the magician himself and on those, whom every such "medicaster" provides with magic service. Moreover, people who had nothing to do with it can also get hurt. Here we are talking about pure interconnection of Conscious with the levels of the objective reality and the accompanying this process responsibility.

Consequently, all the shows and psychics rubrics, one way or another connected to this topic, are harmful and contaminating the overall energy-informational environment and, as a consequence, the collective psyche of society in general. It is obvious that the church rituals have the above elements of mechanic, but the conclusions are made by each individual separately.

24   'Torsion fields and informational interactions', (Торсионные поля и информационные взаимодействия). 2010.

matrix and solve a set of relatively non-standard tasks within saving the control system, possesses intelligence, in this general case. If any representatives have distinguished greatly when solving the tasks on the stability of the control system for a long period of time, they are then provided with outstanding positions in the authority system. [25]

In its core, intelligence is a person's ability at relatively full degree to control the whole complex of interfaces of his own psyche to proper orientation in the whole stream of external and internal contours of information and steadily move forward on the way to Higher Education, broadening the cognition area.

At a certain level of intellectual development, there is generation of new knowledge for the benefit of humankind, considered as part of general Creation, not as part of some narrow control system, or individual tasks, appearing on the way of evolutional development.

* * *

We have to leave the topic of education for a while till we figure out the matter of technologies. The **open** code systems develop in parallel with the development of informational technologies, representing its integral part. It is difficult to say today what will happen when the technological, informational base disappears and won't fruit any longer in the world of human interaction.

---

[25]   Organizations are being built to these needs in addition to bonus distribution, grants and a provision of access to air of different mass media.

Technologies

The study of social structure should go along with the study of technology development. It is quite an interesting topic. Yet, few consider this process drawing a parallel to the process of human conscious evolution.

Let's place the task of considering these two processes in the analogy. Following this logic, we can easily predict further development of the technological base, excluding conjectures, and showing that one or another pal does not "see the future", but simply builds a chain of analogies, putting it onto the realias of technological development, drawing upon the basic principles and abilities of psyche and conscious interfaces.

Surprisingly, but even in this heartless world of figures, resistance of materials and circuit technique has a cause-and-effect relation to multidimensionality of space.

The technology topic as a derivative from ideology is quite a serious topic. Its derivative gives birth to whole worlds, capable of synchronizing quite big cross-sections of society, both in the direction of inclusive development and total degradation. To generate ideologemes in any of these directions, one needs to understand the point of space and time, in which one or another ideologeme will spread in masses.

Certainly, any ideology is an instrument to synchronize society, consequently, it is an instrument to control large masses. If worldview is an operational system of psyche, then the adopted ideology is adopted software, with the help of which one can reach one or another result. The software is written by the subjects of the information technologies world. It can have either a destructive part, destroying all the hardware, or a constructive part, aimed at creating a new content.

The topic of technologies itself today is integrally a topic of ideology, moving huge layers within the interests of millions of people and technological companies. But it was not always so. In former centuries, the development of technologies did not have such a swing, and during many centuries nothing really changed.

Today humanity is up against a task, which is to be solved as soon as possible. The only problem is that on having started the flywheel of technological development, the control system did not take any steps in the direction of worldview base development to draw society out of the control of materialistic cult, giving it, this way, an ability to change the guidance in the field of intentions. The fact of such conjuncture shows that the visible structures of the control system are not ready to leave their power in the name of saving our mother Earth. This supports our conclusion that the control system is the same inertial mechanism, which needs external interference to change its algorithm of functioning. [26]

---

[26]   At first thought, there may be a sort of contrariety. How is that possible that the upper floors of power have the worldview, which is relevant to the unified Design, and the system, controlled by them, is inertial and needs external interference? In this case, the only thing that plays role is the complexity of the system itself and the established principles,

Technology Development

Let's leave the credit-financial system influence on the technology development, and take the basis from the fact that any invention is a human creation. Consequently, a person, in the process of operation on one or another new technological solution, uses personal interfaces of psyche, controlling, at different degree, own conscious and non-conscious levels of psyche.

As we already know, the collective non-conscious contains a huge layer of information, and every person interacts with this volume of information one way or another. The collective non-conscious also contains the information on previous embodiments of every person who is in contact with it. The collective non-conscious is a kind of mechanism on interaction with the Noosphere, and is its part.

If we take into account that, in the process of inventing, a person follows a certain idea, which, one way or another, can simplify the interaction between a human and nature, a human and humans, then a person gets his ideas from some kind of general container of ideas, kept in the Noosphere, which may represent a memory of previous, now present, or future possibilities. Any creative person, whom is any inventor, is always (since the moment of his birth) better at interacting with personal psyche interfaces towards other people. Yet, it is not always that this interaction is expressed in the world-understanding, i.e. it is not necessarily that every person is duly able to explain the processes, happening at one or another moment in the process of his intellectual, creative activities.

The Noosphere is a projection of the Earth conscious, concentrating in itself all the worked out information during the entire global evolutional process of humankind. Theoretically, if we consider that everything in our world has conscious and is an integral part of Unified Conscious of the Creation, then the Noosphere can be controlled. We can also concentrate different holographic structures, by means of which different ideas will be realized.

Thus, the Noosphere is a living organism, emanating the ideas of new forms into the world of earthy realias. The only way of forbidding the encryption of the Noosphere holograms is a discussed by us method on implementing the worldview with **close** codes, when the proper activity of the user is blocked through the traditional behavior culture, including the system of prohibition.

Due to this, the information from the Noosphere is decrypted into the ideology, overlapping on the images of matrix manifestations, and is partially transformed into a layer of technical solutions.

The control system task has always been the task to control the development of technologies. Thus, technological progress is a process, controlled and regulated by the floors of the control system.

---

within which the system has existed in the former logic of social behavior. If we look closer, the demounting of the system today is obvious. Its origins are influenced by both natural factors and the winding down of the system from the upper floors of the hidden power.

At the Origins

We need to take into consideration the fact that our civilization is not the first on Earth, and there were some highly developed civilizations before, which had the technologies we still do not know about. [27] If we take this fact into account, then we can bravely think of the sources of knowledge, which are hidden from us.

In order to make sure that technological process is a controlled process, we only need to look at the history of Ancient Greece, particularly, at a scientist named Heron, who lived there in the first half of the 1st century B.C. Back then, this man had already established the basis of mechanics, optics, metrics, algorithmics. It was just necessary to continue to develop technologies, massively implementing and organizing on its basis production and education. However, at that time the control system was solving absolutely different problems, aimed at saving the system after the so-called intrigues of the "messenger". The fact of the appearance of such inventor at that time sort of tells us about the consequences of the excited Noosphere.

It is quite possible, that this case of idea uptake was not the only one in the antic history. Nevertheless, that era was marked by the presence of an iron axe, and the principles of the society order were the principles of passing on knowledge from generation to generation. The main task of fathers was to give their sons the skills of crafting and trade activities. The stability of such behavior algorithm was obvious, as during the many generations nothing really changed, that is why it was possible to predict within the family the sufficiency in the availability of skills in the succession of generations, providing all the necessary to the posterity.

If we take into account the fact, that a person is endowed with creative abilities by nature, then if we consider the global historical process, we will see that a person has in many ways tried to tame nature, in desire to decrease its natural phenomena influence on his life and on simplifying work. The technologies represented by simple tools and the energy of domestic cattle helped him in that.

Within such behavior logic, the traditions expressed in the culture of people behavior were quite stable. The reason for that is the abilities and skills of the elders to orientate in space, and also the stability of external connections, when in parallel with passing on the experience at interaction with working tools, the system of external connections was also passed on. This system was the basis, on which the communities with its authority system were built during the centuries.

It is obvious, that the authority system of the community set the vector of development within the planning range. The state existed as a mechanism gathering render, and performed a function of a tax collector. It also solved the problem of power stability in the intergenerational continuity, at the same time developing forces to protect the territories. The authority system

---

27   As to make sure of it, you can watch a cycle of expeditions "Laboratories of Alternative History" to the countries where one can see the buildings and items of ancient culture with the marks of processing, which were made by the instruments we still do not know about. http://lah.ru/

within the state was fixed in society psyche and provided its stability due to personality cult of the first persons.

There is no need to be literate to pass on knowledge within families and communities. Everything that an ancestor could pass on to his posterity, he passed in oral form and during the process of crafting. Interacting with his posterity in this key was enough, except the variants when the community made a decision to send one or another youngster to digest external territories and new skills. It was when literacy could be of use in assimilating the crafts, which had not been assimilated yet.

If we take into account that a person performs his activities on the basis of information-algorithmic support, then we can model quite a simple system of structure and structureless control within the same logic of social behavior, based on the low working efficiency due to the absence of proper technologies, and, consequently, within the low level of literacy in society.

If we take into account, that the degree of literacy of society was quite low, then the controlling influence was to be held in oral form through the system of the trained "bawlers" and informers, and also through church. The church in this case so much better fitted in generating the structureless control. The power and the church have always worked side by side, realizing the unified mechanism of control and performing through minor orders, in its general mass, the translation of controlling signals through the authority system. From aside, such interaction can take the form of oppositional confrontation, but in reality, the church is a function of the state, being a visible structure of the control system. [28]

For church protectors and churching we would like to admit this: the given function of the church, of course, is not a fundamental one. The principles of church construction knowingly put the control system into the position aimed at saddling the church mechanisms of information transfer, and the minor orders are seen by the system as potential servants for the benefit of power interests. If we apply and lay onto the notional base of today the church functional, then this formation may be applied to as the system of mass media. Churches had and still partially have the key peculiarities:

1. The authority of "god's intermediators" in the eyes of the crowd;
2. The density of crowd concentration during the service;
3. A special mood of the crowd when attending the church.

---

28   As of today, the church has a function of culture memorial, and the parish performs on the territory of the church, more automatically rather than within the deep comprehension of actions. The church has lost its function of "educational institution", where within the church-parish school it was possible to assimilate the basics of literacy and learn to believe in the king and god. Although, some progress in the direction of tradition reincarnation take place, but it is only due to the degradation of the general knowledge system and general goal-setting of the control system.

If the church took responsibility to realize the spread of the worldview **open** sources, then the church would have to reconsider all its history and define its spot under the Sun within the general Design, which contradicts the meaning of the priesthood, the heart of which at today's functional lies in strengthening its status in society by means of breeding with the power and in the name of sausage cane.

These factors are one of the key ones at performing control in full function. If there is a necessity of churching in different cross-sections of society, then people should be provided with the system of information filtering and the system to process it. Only in the process of comprehension in providing these systems may appear the understanding that the church and churching have no fundamental base to generate the process of Life comprehension, which can calmly flow within any point of space-and-time without any intermediation.

* * *

At this system configuration of the control signals and the system of backward communications, the speed of realization of the set by the system goals is quite slow, and it was one of the peculiarities, influencing the behavior logic of the control system structures. At slow speed of the environment condition change and within the stability of the traditional behavior matrixes, there was a chance to perform through the floors of the control system quite a stable in time goal-setting, and not to change the system configuration for quite a long time.

However, that era had its own peculiarities, if we consider the control system as a mechanism aimed at control of man and nature sources development. To be specific, there was a high possibility of conjuncture, when the rulers could possess subjectivity while comprehending their ruling activities, and, basing on certain structures and society orders within the comprehension, possess the sufficient power to build the ways of development of personal empire or state.

Social Behavior Logic Change

It kept on for quite a long time, until, in the middle of the 20th century, there was a social behavior logic change, which entered its extreme phase with the appearance of the Internet. Social behavior logic change is characterized by the fact that during the period of generation change, the volume of its factual knowledge to be processed, aimed at stable functioning within the society matrix, increased a lot at quite a short period. Thus, the perception of the authority of the adults, who, due to growing in a former logic, stopped orientating in technological space, has changed and the young generation became more flexible and more of adopting in the modern world.[29] Consequently, society lost the mechanism, engraining some traditional behavior matrixes.

Educational system mainly lost its efficiency due to the fact that within the new logic, there is a need in another approach to assimilate knowledge system.

If at former behavior logic it was possible to forecast the development of society for quite a long period, then at social behavior logic change the forecasting activities face a range of obstacles.

First of all, due to the absence of proper understanding and goal-setting in the direction of new technology development, even at understanding the possible picture of the future, there

---

29   This aspect is quite general, the traps and pitfalls will be described below.

are difficulties in giving up the principles of current technological patterns. The reason for that is deeply established infrastructure, which has fixed behind its service in the control system quite stable financial streams, which leads to the creation of a certain order of "elites" unready to give in. The global system of labor division was built in such a way, that **the entire states are responsible** for different infrastructure projects on providing the world with recourses, engineering projects, production capacity and so on, which puts the change of technological patterns into more difficult conditions, when the entire power systems, made under strictly defined functions and financial streams in the global labor division system, are to be destroyed.

Secondly, some difficulties occur due to the shortage of methodological education in quite a big society cross-section. The thing is that even at present technological patterns, when the rate of energy consumption (kilowatt/hour) is quite high even in technologically hindward countries, it is necessary to implement cognition methodology so that society could calmly and independently assimilate new knowledge and form, on its basis, the degree of personal understanding and develop on its basis moderate consumption. [30] It will be difficult to give society, which has no idea of the fact that it only needs to meet the basic requirements to function normally and develop within the General Design, a possibility to use free and endless energy, the basic principles of reproduction of which already exist.

If we take into account that, on having entered a new logic of social behavior, the mankind needs to reconsider its technological development quite cyclic and in quite short periods, then we can see time expense on the creation of a completely new social order, within which it will be possible to easily reconstruct infrastructure, without worrying about saving the "elites", controlling the technological patterns. To do this, we need to develop constant fundamental principles of technological development within the external and intensive cycling at technology change. The possible solution is an idea of building the so-called circular economy, the principles of which are to be laid on the development of social processes in general, when any person's potential will be important, and the control system task will be in building the vectors in the directions of society endeavors.

The main barrier which such "elites", controlling the infrastructure in the lifetime cycle of technologies within different technological patterns, meet is their inertness and reflexivity, the reason for which is a narrowed world view, different from the view of the gutter world only with a set of factual knowledge, which contradicts the principle of building the systems of direct and backward communications in the new logic of social behavior. [31]

There is also a range of other peculiarities in the new logic, which are connected with the generation of structure and structureless control, which have been transforming since the end of the 19th century, in the end, leading the control structures to absolutely amorphous state, contradicting the principles of the technological era.

---

[30] The world energy consumption per capita is published on the basis of CIA data: http://en.wikipedia.org/wiki/List_of_countries_by_electricity_consumption

[31] Elite in this case is a scientific environment, which has lost its function of generating new knowledge, and being at the moment an empty gathering of dogmas keepers.

The preliminary symptoms characterizing the movement of the civilization to social behavior logic change were marked by the appearance of typography. This innovation gave a chance to get mass basic education, which enables the assimilation of crafts, within which the activities go along with constantly developing technological solutions.

This solution allowed the control system broadening its influence area due to overall establishment of worldview codes aimed at serving corporate interests. Simply speaking, due to typography, society got access to the information, on the basis of which it developed a general view of the world.

If we consider this solution from the public processes acceleration point of view, then the speed did not really increase, but this solution encouraged a more stable establishment of worldview codes and in a wider cross-section of society. [32]

With the advent of electricity a new age started in the world of science, giving a huge layer of technological solutions. The first of them was radio, and then television. With their help it was possible to implement the behavior matrixes throughout society from the power floors, and massively increase the speed of public response to the controlling influences. It should be noted that any technology requires debugging the systems of direct and backward communications with a person for its full usage, which is why the volume of the information, processed in technological society, increases exponentially, and if we add to this the fact that any technological solution increases the efficiency, which leads to lessening of time expense to produce the final product, then the speed of society behavior quality change at interaction with the biosphere of the Earth is quite obvious.

Thus, with the advent of electricity, the adoption speed of the power floors to society process speed began to increase. If we take into account that at the increase of society process speed the stability of control is lost, due to the fact that the power floors lag to process the entire volume of control important information, then the control system enters a turbulence mode. [33]

With the implementation of new technologies into society, the structures of the control system need to change the quality of the information communications between the floors. If we study this process, it becomes obvious that, during the time since the social behavior logic change, nothing really has changed in that sphere, and there is still paper bureaucracy; let alone the fact that the number of bureaucrats per head of the population keeps increasing

---

[32]   In this case won the one, who intensely focused on printing fliers, newspapers, by means of which, feeling the demand of the masses, he implemented the behavior matrixes in society. Such algorithm played a very important role in the revolution of 1917 in the Russian Empire. Although, we need to take into consideration the fact that society literacy was quite low, that is why the principle of "literate bawlers" was used.

[33]   If we remember the scale of personalities in power in the middle of the 20th century, putting out of account the ideological and other noises, then we will understand that their behavior was conditioned by time, and the main differences of that time were such notions as order, will, and responsibility. The degree of importance of these notions directly depended on the scale of personality itself.

nonstop without due increase of their general quality. This feature is a key factor, influencing the amorphousness of any bureaucratic machine unable to deal with its tasks. This feature of technological age is laid on the principle of "elites" and the authority system construction. It has not changed at all during the entire global historical process.

If at former logic of social behavior the state machine, due to the low speed of environment update, was able to perform the control at full function, then at the social behavior logic change and due to the acceleration of society processes the state loses such ability. The reason for that is, first of all, the persistence and sluggishness in decision making, and, secondly, irresponsibility and confidence in lack of options of the present power holders, strengthened by the targeted disorganization of educational system and the absence of the holistic view of the world. The result at this quality of interaction with the environment is the transfer of state power structures under external control, performed by more flexible and adopting to the speed of environment change structures, clear of bureaucracy burdens, and also by the structures, defining the vector of further development of different infrastructural projects in general.

Information Technology Development Logic

If we consider the evolution of the system of information transfer means, we can see a certain logic. It is based on the information transfer over a distance, which is, as a matter of fact, one of the functions of conscious. If we take into account the fact that this function was consciously used by the hierophants and higher enlightened ones to form the matrixes of possible conditions inclusively, then we can lay this principle on the control system of information transfer.

All the technological solutions, aimed at transferring information into the masses, were focused in the arms of the control system structures. The crowd was seen as a final consumer of informational content. Informational sources evolved into the instruments of network structures, on filling which it is still possible to define the direction of the control system in general.

Telephony, in particular, can be considered as an instrument to spread the controlling influence in the masses, at using which the elements come to common denominator and are an element resource to form the matrix of possible states.

We have already worked out that the holographic structure of information from the Noosphere has to be encrypted, so digital and analogue circuit technique, following our logic, can easily be considered as a system of information encryption from the collective non-conscious, i.e. by means of the description language. It should be noted that on the appearance of computer, science started using terminology from the field of computing machinery to describe the processes in human's psyche. Thus, the result of such circuit technique solutions is a derivative of encrypting the information we already have on the hidden principles of interaction between the collective psyche and human's psyche.

The technologies have outgone the evolution of human conscious, but they let us define the basic principles of public processes development in general, based on the spreading of information and gave an opportunity to anyone to do research activities.

The beginning of the 21st century was marked by the intensive spread of the Internet in the masses. On the whole, considering the net in the process of its development, one can find a sort of understanding of the processes, going on in the collective psyche, as the Internet is a symbol and a projection of the collective non-conscious.

Collective Non-Conscious Projection

The Internet in the past quarter of the century has grown from communication means for would-be scientific fields into global net, uniting milliards of people. As of today, access to the World Wide Web is possible due to the devices fitting into a common pocket. Just recently, a stationary computer standing in the room without the Internet connection was something sluggish, where in order to fill its memory with necessary content, one had to perform a "run"

with a "hard disk" and a jumper to the friend, who has access to the net and, consequently, has lots of interesting things in memory.

On having connected to the Internet, the computer began possessing "superpowers" and at first, some users turned shock at comprehending the real computer abilities with the connection to the global web.

The human is absolutely the same thing. The similarity can be seen even in cases, when conscious is fully covered into psyche. In this case, the analogy is the computer, serving just as a system to receive and install updates, and the user is like a reacting mechanism, responding to different kinds of banners and the areas set aside for the commercial "yellow" resourses. At such principle of interaction, the Internet, as a means, is seen as something superficial and, on the whole, something incomprehensible. The developer community of informational portals considers such users to be the main resource, whose responses can actually bring the real money by increasing the traffic.

The creative process, when the hidden psyche interfaces are involved and the synchronization with consciousnesses of the objective reality takes place, can be compared with a computer in the process of creating new content, when a user by means of search requests is looking for necessary material and software, and realizes on their basis new images. The most successful in that activity will be the user, who is able to formulate his search request most properly, and, consequently, who will most quickly find in the entire information stream necessary material. Also it will be the user, who will be able to use the software most cohesively, in the end, expressing a certain final artifact through its functional.

The whole process of content viewing on the Internet is carried out due to the interaction of a stock of servers, each of which has N-manifold of domain names, distributed according to the principle of multilevel DNS.[34] Each such name or some number of names is tracked by the system administration community, monitoring their processes and realizing their smooth operation.

The entire process of server interaction, debugging, setup and deployment is out of common user sight. On the whole, the set of these processes is realized by one technology, which brings to conclusion that this general process of administration goes in an auto mode, where one of the tasks of a system administrator is to lay the main principles at deploying a new system for its further smooth scaling and simplified control, and also to debug the security system.

If we apply this principle of system construction to the collective psyche, then we will see a certain analogy. The process of gathering collective psyches also goes on in an auto mode, and it is a process, independent of a specific actor attention, connected to this process and feeding the collective psyche by the energy of its participation. The role of a system administrator is in revealing the attenuation of actor activity towards one or another action, and

---

34   DNS – Domain Name System

in possibility to perform further connection of the statistically defined section of actors to a new exciting process aimed at its further energetic feeding from them.

Such activities of the doers, the attention and energy of which is shut at different processes, **organize the process of the collective psyche assembly**.

Thus, the Internet is the projection of the collective psyche and non-conscious, and also the processes in the collective of real people can be controlled, and the process of its assembly can be regulated by means of the World Wide Web resources.

It follows that mankind got a chance for the first time in deliberate history to regulate the process of personal development and evolution without the external intermediary represented by the control system "floors".

Hidden Energy Projection

An external shown world is nothing else but a manifestation of spirit. The ruling party controlling space-and-time is in another dimension. As the special features show themselves in individual's psyche, an individual is able to move along the hierarchy of the objective reality consciousnesses, and in the process of constant gem-cutting personal conscious, influence the physical world consciously and energy-informationally.

> **' … Telekinesis, caused by living organisms, should have energetic basis. Here we have to remember again about high-energy phosphorous compounds. Unlike mammals, that have phosphor mainly inside the brain – cerebral and spinal, fish also have it in great quantity in muscles. Here is a question: why do fish need phosphor?**
> **However, there was a message in literature that a pike (and fishermen say that taimen too) can make a jump in water, when hunting its prey, without moving anything and without repelling water. At this it can make a jump only once, after that it has to rest for a while and only then it can repeat the jump. Isn't that a reaction principle using ethereal repulsion? It would be nice if ichthyologists could confirm or deny this message…'**
>
> *Aether-dynamic hypothesis*
>
> *V.A. Atsukovsky*

Nothing can manifest in the world of three-dimension forms until the thought form of the creator is expressed. A thought form is a derivative of thought image and has a dense concentration of energy, realizing in the physical world. [35]

---

[35] Sometimes there are situations, when a request in the search service doesn't have a proper response due to the lack of necessary information. In this case, this single request can serve as an exciter of the collective non-conscious contours and can eventually project the requested informational module through a statistically definite actor. The actor, in this

If we lay this peculiarity of the objective reality onto the world of computer technologies, it will be obvious that there is a possibility to realize ideas by means of CAD[36]. This technology reflects the process of thought form materialization most coherently, where the source of the thought image in the projection process is the engineer itself, and the computer program helps to form a clearly designed virtual 3D model, on the basis of which there is a chance to express physically designed prototype.

Until recently realization of parts was available only for the possessors of production facilities, which is a sort of initial development stage of 3D model creation technology. This opportunity showed itself most massively with the appearance of 3D printing.

As of today, the realization of such 3D "thought forms" by means of 3D printing is based on several different principles, but the point does not change because of that. The difference is only in the occupied area for instrument installation.

We will not argue about how harmful this technology is for the biosphere, we will only note that it is harmful just as much as there is interest to this technological solution from the control system structures, and how they are capable of regulating the process of development of this technology in the direction of influence decrease on our planet ecology.

Let's note, however, that the project RepRap[37] was meant as a mechanism to process plastic waste into useful in domestic life things.[38] Later on, on the basis of this technology, appeared the ideas of building constructions on the Moon and Mars, and the Chinese are printing houses here and there.

We should also note that with the advent of 3D-printing into the world of information technologies, this technology has taken the movement of open systems to the new level, particularly, gave a new stage under the name of "Open-Source Hardware", which is an absolute advantage towards the construction of different solutions within the closed corporations, and allows realizing the projects within the society of enthusiasts, who, adhering to the principles of movement, are not stingy to make their groundwork publicly available.

The ability to reproduce tools out of metal brings new possibilities into the world of people interaction and makes them bring their attention to the new level of responsibility, broadening its area by means of technological solutions.

---

case, will have a creative breakthrough and the desire to realize the request.

For that matter, if you ran into a similar situation, you can be sure that if the request was accompanied by a high desire, then the matrixly projected response towards your request is already there, only the access to it will be a bit later.

36   **CAD** – Computer-Aided Design

37   **RepRap** – Replacing Rapid Prototyper

38   There are plenty resources in the net to exchange ideas, one of which is http://www.thingiverse.com/

Nevertheless, this opportunity makes us not only look at the world absolutely different, but it also makes us develop spatial thinking, without which none realization by means of CAD will be possible, that is why massive spread of such technology into masses is limited by access to special thinking and desire to develop it. This will be impossible in general without proper support of the external structures and the degree of realization will depend on the inborn potential in a society cross-section.

Elon Musk takes part in the commercial realization of this idea. He is building from the ground up Tesla Gigafactory, the task of which is to fundamentally decrease the operational expenses on line employees, parts transportation and resource processing. Everything will go on without a single person within the territory of one factory, where only resources will be supplied. This factory, at face value, will give a push for absolutely new age development, when at the global level, a huge layer of human resources, brought up in the former industrial age, will be set free. Moreover, this approach will devaluate technologies as such, which will lead to the tendency of investor reorientation and will focus their attention onto more stable in time environment factors, influencing further development of the entire humanity.[39]

Different Logic of Hidden Control

We have already defined that conscious is a multilevel energy-informational system, represented constructively in another dimension, whose potential is hidden behind the noise influences of psyche, which is a function for interaction with a manifested world. Thus, the bearers of special and relatively sufficient understanding level and the representatives of quite coherent worldview are capable of deliberately using most of the functionality of conscious.

If conscious is able to transfer and receive information from the "outside" of space-and-time continuum towards the localization of the physical body, then, consequently, any information can be captured, especially, if there are any egregorial-matrix discharges, expressed in eventivity. This process of capture can be marked as a coherent process of interaction of developed consciousnesses. In other words, if for some people, on the lower level towards the degree of understanding, this process is a process of information capture, then at a higher level, it is a process of consciousnesses interaction, multidirectionally flowing into the process of Will confrontation.

The analogy given above is not accidental, and we will try to bring the entire information technology development logic into one, reinforcing its basic algorithms and introducing it in the general concepts of the reader.

What is a hidden control? The control is hidden in the case, when a person cannot reveal the controlling mechanisms and act in his daily life without thinking of being "under surveillance". Nevertheless, each person under control can have a clue of different target

---

39   As it is quite rational – to establish the principle of flexibility, due to which it will be possible to produce absolutely different form-factors at the initial stage of designing such gigafactories, without fundamentally changing anything within the factory, only establishing a general idea-model into production.

structures aimed at performing the control function, and can partially know their methods. In any other case, any revealed control is open, i.e. comprehended by the controlled object.

Every time a hidden control comes into the category of revealed, this control takes forms of comprehended interaction with the controlling target structures, and can be a tool for deliberate disinformation delivery. The second variant is more possible in the case, when the controlling target structures have not deliberated the fact that their control is already revealed by the object control.

Now let's pass on to the link of the main question.

Let's imagine for a second the moment, when in order to do the tapping it was necessary to, for example, put a "glass" to the wall and lean your ear against it, or to hide in a private place. Such method became irrelevant with the technology development; yet, it made target structures to break into buildings as to install listening devices and video cameras.

Today everything has fundamentally changed and in order to have an idea on different actions of one or another object of control, one only needs to access his communication means. Here we can see a full freedom expressed from installed into prototype computers microphones and cameras to the same in smart phones that an object carries in his pocket. In the latter case, the access to a conversation in smart phone coverage can be provided even if it is off. We can also add to this binding an IP address to each of the devices and tracking search requests in the search service, and also all the user activity in the net.

Due to this, any person, who has shown the will and broke out beyond the lines of the programmed matrix is an object for total control and researches, so one should always take into account these methods and bring them to the level of informational interaction, at one of the stages of which you need to let the target structure know that the process is revealed and the behavior can subjectively be corrected.

Let's also notice that if we take into account the fact that prior performing any actions in today's real world, any subject collects information, on the basis of which he will act in the process of reaching his goal, then we can see the importance of search resources. The activity of the requests can be the basis for building the picture of the upcoming streams in public processes, i.e. it is possible to reveal the process of collective psyches gathering in the widest society cross-section. [40]

Summary

All our logic review on information technologies development can come down to one point, characterized by the fact that all the logic of their development projects the collective non-conscious through the IT industry. The task of each consumer comes down to different

---

[40]   Google partially gives this opportunity represented in a whole project Google Trends – . If we dig in the most popular requests, then we will see that the quality of social processes is at quite a low level, and the main cross-section of society is within the simplified desires aimed at consuming "panem et circenses".

functions, which can be marked in ascending order of behavior comprehension degree in the virtual space:

1. Informational content consumers;
2. Informational content creators;
3. System administrators;
4. Representatives, performing hierophantic functions.

As a matter of fact, the abilities of the Internet and the development of computing technologies gave us a chance to actually watch the processes in another dimension, and build an idea on the basis of their general projection on their algorithmics. This opportunity defined the vector of development of the entire industry of "high technologies" and made people cultivate the interfaces with the outer world on the basis of new principles, expressed in the given to us by the industry tools.

The industry task comes down to propping up its companies due to technology development and supplying the user with a simpler interaction with the surrounding world. Due to this trend, companies define the development vector of the entire states, forcing to set mechanisms for providing direct and backward communications with society. The role of the states, in this case, comes down to elementary obligations, aimed in the worst case at road construction, and in the best case at regulating the general vector of society development. The second variant, strange as it may seem, is an exception, and every person sees this vector within the general "depravation" of the "power" representatives.

In general case, the task of the "amorphous" state, represented in the sluggishness of the entire state machinery today is a sort of reactive mechanism, functioning in the mode of response to different excitations in the "virtual space", when the layer of bureaucrats perform their functions, shifting the vector of personal action more and more in the direction of external environment absorption, and sees it as a potential means for further "partitioning".

If in the former logic of social behavior the state could bare the function of society control function by forming the external informational background due to informational resources, focused in the arms of state machinery and aimed at forming the matrixes of possible states of future state development, then today the state is unable to perform this function in general, and uses the IT-industry[41] tools just in order to keep their positions in the nearest perspective. Moreover, there is an intentional destruction of the entire knowledge system, built in the past century, and any attempts to provide society with the methodology of cognition are excluded. This process can be characterized as a reflexive confrontation between state machinery and the upcoming age principles, which more and more shows its general logic of further development.

---

41   In this case we need to take into account the fact that IT industry lays its mark on the television and radio broadcasting sphere as well, within which the tools of the Internet resources are more and more particularly pronounced.

Thus, everything has already worked out to transfer society to a full and stable development in the direction of forming the worldview with open sources, except for the control system structures themselves.

Yet, everything is not so sad, and the most coherent projection of another dimension represented in informational technologies is leading society to another level of movement in the process of Education.

Education in the Era of Information Technology

When considering the matter of education, we have elicited to directions, one of which is the direction of adopting a narrow specialization within the limits given by the control system. The other direction is the process of Education within Life comprehension and building a coherent worldview, where the Creation is represented as a sole and whole information container, where every person, dipped into energy-informational environment, can perform research activities aimed at self-development.

We have brought to light the key aspect, marking what intelligence truly is, and defined it as an ability of a person to interact with the interfaces of personal psyche and Conscious most coherently and at full mode, in order to cohesively orientate in internal and external contours of informational space with the purpose of gradual and stable movement within the process of Education.

We have also cleared the subject of internal and external contours of informational space. In the first case, external contours are the informational background of the matrix, whose codes do the rounds through the authority system of the control system and through a matrixly manifested cross-section of society. In the second case, internal contours are all the information projected on the individual's psyche through filed interaction with the outside world, and also the information, pulsating from the event field of another dimension, and the behavior algorithms, generated by the instinctive part of informational supply.

The era of information technologies has "blown up" the internal contours of informational space, and through the Internet it has projected the processes of the collective non-conscious. Thus, if in the past, without the access to the net, researchers had to do with naked personal intelligence and long processes of information search in the bins of dusty libraries, then now, with this access, every person has a chance to use the functionality of the collective non-conscious, projected on the tools of virtual space.

The past left a mark on today's authority system, when the degree of access to the bins of dusty libraries was defined by the "degree of enlightenment" in would-be scientific community, when today it is obvious that open access to any information is limited only by functioning within one or another language system and the abilities of one or another individual to steadily orientate in the net, properly building one's goal-setting.

The net, being a projection of internal contours of the collective psyche, has quite a definite influence on the external contours of the matrix informational background, and what is obvious, it influences the goal-setting of society, consequently, it forms the matrix of possible states, where people, who were not written down into the authority system within the visible structures of the control system, can be the generator of different ideas.

Projection Destructive Influence

Society, being within the matrix informational background, regulates personal behavior on the basis of its contours and at interaction with its elements. If we follow the accepted terminology, then society in its cross-section is self-controlled within cultural codes, where the distribution of its basic principles is the representatives of the authority system, both within families and the control system in general, behavior algorithms of which are secured by external surroundings. The external surrounding together with the contours of the matrix informational background define the degree of the freedom of choice, which, in return, is defined by the width of access to behavioral algorithms of society cross-sections of different quality, moving within the matrix background.

So, the wider the access of a person to behavioral algorithms of different society cross-sections, the wider his freedom of choice, as on their basis he can project external algorithms on own behavior, and, while comprehending, he can form the freedom of will, thus cutting off from his daily life the algorithms, which do not comply the degree of his level of comprehension.

The quality of the era is such, that by accessing the World Wide Web, people can broaden their area of the freedom of choice due to the net resources, which is mainly expressed in the principles of "social nets" construction, where every person can join the community of like minds within universal space, and during his activities independently form a personal range of interests, joining new or creating own "ranges" of interests. The quality of these interactions is projected on society behavior outside the virtual space and defines the vector of its further development and connivance depending on the shift of the vector from the universe Design.

It turns out, that with the Internet mankind began interacting with the external world outside the clear limits of behavior, defined by the control system, and got a full freedom within the acquisition of the freedom of choice, which reflected on the general quality of public processes, when a general cross-section of society functions without orientating on a unified authority system. Consequently, the control of such society within the system of crowd-"elitarism" requires a lot more resources with the purpose of forming its further stability.

This peculiarity, influencing human behavior, subtilizes the contradictions between generations. It is characterized by the fact that the younger generation is more integrated into network space than the generation, formed within a different behavior logic, which left a mark on their principles of interaction with the outside world. Thus, the younger generation functions outside the authority system of the older generation, which complicates the upbringing even more, as a younger generation orientates dipper in the outside world, completing it and simplifying interaction with it by the tools from virtual space field.

The principle of simplification of space orientation by means of network sources also lays its mark on the principle of external connections system construction. If at a former logic of social behavior the system of external connections of a person was constructed with the aim of mutual decision on unique tasks, aimed at information provision, supplying goods and services, then at present behavioral logic, this system quite fully can be replaced by network resources,

which can directly influence the range of social connections of a person, replacing them with virtual connections and the ability to orientate in the virtual space.

Thus, the destructive part of the collective non-conscious projection is characterized by the fact that society, in general, has lost its clearly defined orienting points and has come into the mode of relatively unsupervised self-control, which mainly influenced the formation of the young.

If we consider new society as an embryo of something new and massive, then we can see a relatively full picture of the next stage of development.

Conscious self-control crystallization

The degree of human understanding lays a mark on their behavior on the Internet. Each of the considered activity levels at interacting with the net has its algorithms of content filling. In general case, the algorithms of content filling can be divided into three groups:

1. Noise retranslators;
2. Goal-setting guides of control subjects;
3. Control subjects.

The first two levels are the consequence of reflexive net organisms' activities that are in different informational planes, contours of which are defined by the adopted ideology and propensity for one or another cultural matrix and language system. The third level is quite relative, as on each of the first two, the user, generating content, can pursue clearly defined aims. The relativity is defined by the already considered degree of understanding, influencing the formation of the freedom of choice and will.

Within every level, new informational modules can form due to content generation towards the ideology, moved by actors and within one or another informational plane. New informational modules, in return, influence the perception and objective reality analysis systems, completing it with new tools, due to which every person, adopting it, broadens the specter of the tasks to be solved within the given, under one or another tool, informational plane.

We need to take into account noise concentration per significant information aimed at movement in the direction of inclusive development. For an outside observer, not interacting with the World Wide Web, the Internet is a container of unconnected and useless information. Content consumer perception, at the initial level of interacting with the net, functions in the same key. The only difference is that an outside observer supposes, and a consumer absorbs the noises and projects them into external environment.

But, as the matter of fact, the Internet is a "multilevel" container of information, and it is usual for every interest to feed with a proper content. It also means that the existing information for one consumer is absent for another as the chain of "request-response" actions is both a reason for information-algorithmic user supply and the consequence of the fact that the

information-algorithmic supply of a person, showing activity in the network, excludes the possibility of conscious perception of information beyond the limits of subjective interests. However, any information, which is projected at non-conscious levels of psyche, can eventually "grow" into some factor, allowing broadening the range of user interests, widening the corridor within "request-response" actions.

Within this model there is only way out – absolute broadening of the degree of personal understanding and broadening of the skill system, limited by one or another informational area with its strictly defined information filling.

If we take into account the hypothesis of new informational modules being a consequence of social request, concentrated on the collective non-conscious through the process of energy-informational exchange, then any information in the net has its consumer. Thus, the quality of informational filling of the Internet is a "litmus test", defining the quality of public processes, both within one or another cultural matrix and a language system, and the quality of mankind in general.

Reflexive interaction with the net and projection through personal behavior of some freedom of choice into external space form a clear matrix of eventivity, reflected on the participant's psyche, which, depending on the distance of actions algorithmic from the general Design, forms a clear set of images, fixed at a non-conscious level by cause-and-effect connection. Setting on non-conscious levels, cause-and-effect connection **is a certain set of program codes**, and due to the fact that a person's conscious is a consequence of synch with the Conscious of Higher Design by default, it can influence the behavior of an individual, brining into his algorithmic:

1. Faults and inversions both at event analysis and at direct interaction with the outer world, when external environment negatively influences an individual with its eventivity;
2. Some comprehended much, which is the beginning, at coherent worldview formation, influencing harmony and productivity when making decisions and setting goals.

The second level is a consequence of the activity at the first level, and it is expressed in individual's understanding that Life has its laws and influences with its events every living being, giving a chance to open one or another hidden creative potential and reveal a certain design subject to every Life participant.

Within the first level, there is an interaction with the environment in the mode when the environment, being a function of the Design, **corrects an individual's behavior with eventivity**. The individual's comprehension of such correction goes, depending on the environment safety, within that cultural matrix, in which the individual interacted before, having dipped into reflection, **the reason for which is freedom of personal choice broadening**.

In the former logic of social behavior due to the absence of general informational environment filled with informational content, there was a chance to reflexively do with the

behavior algorithms, programmed within the control system. Which was a sort of:

1. Repression mechanism for manifestations of the collective non-conscious, projected in behavioral matrixes of society;
2. Denial of possibility of manifestation in the contours of matrix informational background of some alternative, within which a person would be able to form a comprehended interaction with the interfaces of own psyche, and on the basis of this enter a self-control mode.

These two peculiarities are the functions of crowd-"elite" system of social order, when the degree of intellectual, moral and civilization development of society is defined by the control system hierarchy and the degree of overall understanding on the levels of the power floors.

Today's matrix of society development gives society a choice of many directions without clear orientation on a unified source, which brings the already considered frequency diversity within social behavior. Nevertheless, society within this model and in a new social behavior logic got a chance to independently comprehend the general movement of mankind, and, on the basis of comprehension of how to generate new informational modules, summarize gathered by mankind experience and reveal on its basis Panuniversal Design.

Such algorithm of interacting with the environment can manifest through non-conscious behavior and even without proper understanding of doers of all the specificity and depth of the matter, it can give results capable of revolution in the minds of entire generations.

"… We begin to comprehend human society and its surrounding environment as a whole system, the uncontrolled growth of which serves a reason for its instability. The present reached absolute level of this uncontrolled growth, determines high persistence of the dynamic system, thus decreasing its flexibility and ability to change and adopt. It became absolutely obvious, that there are no inner cybernetic mechanisms and there is no "automatic" self-regulation of micro-processes in this system. This cybernetic element of evolution of our planet is a human himself, able to actively influence the formation of his own future. However, he can solve this task only if he has the control of the entire surrounding habitat… which may mark mankind entrance into a new phase of psychological evolution".

Personal qualities

Aurelio Peccei[42]

The Process of "Elites" Degradation Accompanying Education

We cannot shy away from this topic, not having described the process going on in parallel.

42   The quote is taken from the book by Sergey Yagishnyats 'Gods' Twilight'

The closed source system is characterized by a certain fundamental hierarchic interenclosure at its construction, particularly, by the fact that every level bears a whole layer of closed sources and the movement towards a new, higher level of the system is stipulated by an initiation stage, which should go in the direction of accepting the algorithm of the entire system functioning, both by the floors below, and not denying the principles of floor construction of a higher order. The system represents a complex logical mechanism, assembled "without gaps", where the applicant for promotion in hierarchy should possess characteristics, stipulating loyal attitude towards the principles of system construction and, if possible, not question the cultural codes of behavior on the power floors.

If we analyze the external environment, it will be obvious that the entire social system of any state is built in this key, where the main algorithms of moving through the hierarchy are established on the initial levels of individual's movement within the floors of the control system, particularly, from the stage of getting secondary education.

Such algorithm of public processes development is stipulated mainly by the privacy of informational sources and the absence of access to functionality for interaction with the environment, when while promoting along the floors of the control system, a new higher level of confiding is provided, and the degree of access to the tools is broadened, represented in:

1. Access to service sphere;
2. Access to technological solutions;
3. Access to external connection system;
4. Access to information sources.

The ascension along the way of personal development and within only personal desire in the **closed** source systems is practically excluded, *as an individual should go through the system of natural selection, provided by the closed sources of cultural matrix*.

This principle has one distinctive feature: each such applicant of promotion is stipulated by the pressurization of an individual towards the floors of a lower order, when, while accessing the considered tools, the access to common for a usual person daily routine is limited due to a wider service sphere. This process fixes individual apartness in bureaucratic minds towards hierarchically lower floors of the system, and each such bureaucrat loses the connection with the facts on the ground of society, more and more abstracting from the factual tasks, aimed at developing the controlled activity spheres, transferring their main attention and activity to secure "clan" positions on the power floors.

Due to such access to a wider service sphere and due to power bureaucratization, bureaucracy becomes a hostage of such situation, due to the fact that bureaucracy starts to solve only the egoistic problems of personal survival, which is why due to constant inside-species confrontations, the target function of objective information transfer from one office to another loses its quality and mutates into disinformation, or into its fragmentation. If we also consider that the principle of informational interaction of bureaucracy does not comply the

speed of processes in modern society, then all the effort of social labor activity is used only to support the "elites", and there is no discussion on the development of state or society at all.

Thus happens the "elites" degradation and, as a consequence, total degradation of state institutions.

Such state of matters forms a closed class of power usurpers, blocking the movement of social lifts for society representatives, in which powerful shifts arise in the direction of toll possession due to information technologies, which is more correlated with the facts on the ground and is closer to life conditions. Society gets a chance not only to possess information, but also to form the order of the day, which contradicts the idea of bureaucracy, whose existence at initial cause was aimed at information control and state resource distribution.

The function of bureaucracy is only algorithmic, i.e. prone to automation. If we consider an ideal bureaucrat, not spoiled by retrogressive machinery and as a person-function, then such bureaucrat, anyway, loses his human appearance of a creator and drains his whole creative potential into the area of personal biorobotics. Considering the fact that bureaucrats production takes state resources, spent at the initial stage of their education within a narrow specialization, and then on their further "labor" activities, then obviously that the spent resources cannot be related to the quality of their service in today's world, when a hundred people of the same level and function can be replaced with a piece of a code within the unified service of state need supply.

At authoritarian regimes, when bureaucracy is fully controlled by the head of the state and the control is performed by power and security structures, bureaucracy turns into a completely slumpy environment, when at its level; besides total absence of creative process, any kind of initiative is absolutely unacceptable, both on bureaucracy machine level, and through its vertically orientated structure; the initiative, coming from the level of country's citizens, is blocked.

Today's market of services represented as business projects, whose sources are people out of bureaucracy machine of one or another system, due to objective reasons, deals with contradictions, based on people's competing interests and controlling organs. However, bureaucracy due to resource control, partially aimed at distribution between power structures, can usurp the service market in its interests, due to the fact that the level of understanding of the creators of business projects formed within the **closed** source system. At this quality, public process development does not gain a proper support from the active part of population, due to persistence of society cogitation, but it does not stand in the way of developing understanding of general course of life in that part of population, which is aimed at forming the **open** source worldview with the tools, represented in provided services.

As of today, the state should represent an online service for citizens, aimed at simplifying access to information, medical care and infrastructure projects. If we maximally exclude operational expenses on bureaucracy machinery and their appetites, then this complex of services will be seen in multiply reduced form for country's citizens, which eventually will lead to

building a real socialism with a proper level of freedoms and perspectives for development, as life resources of society will be spent not on the self-survival and feeding "elites", but on self-development.

Education in Economy Automation

Any state economy can be described as an inter-industry balance of product exchange[43], which is represented as a table (matrix), where each column (X_i) and line (X_j) has its branch. Branches are distributed to the right and downwards in the mode of interenclosure, when within the table lines, branches go serially and consume the production of the branch, for which one or another line is responsible straight to the final consumption product. While going down the table, the branch, responsible for the line, is incremented by a unit referential to nesting in economic system. Thus, if we consider that each branch of today's economic reality uses kilowatt/hour of energy, then it is obvious that the farthest on the left and at the top will be the energy branch responsible for energy production, and the farthest on the right according to columns will be the branches responsible for goods and services production, satisfying the specter of needs[44] stipulated demographically. Consequently, each cell of the table will reflect the number of expensed product units, spent on each branch, for which a column is responsible, and on the unit of reference time, chosen to describe the entire interindustry balance, and considering the whole cycle of final product and service production.

This table at automation of planned economy is a monitor in real time, when, together with the development of economic interactions in state, each branch can show the real state of things and find the shortage or glut of the produced goods. On the basis of this monitoring and at representation of real index numbers, the active part of population can build goal-setting towards state economy, turning to the development of those branches that require additional product[45]. In this case, we can see that the function of the state is service, giving information on economic situation in general and in the mode of real time.

At this task definition, there is a question of collecting statistical data in the process of goods and services circulation in one direction, and financial assets in the opposite direction. Here comes the technology, capable of solving the defined task holistically enough in both directions. We are talking about blockchain technology as of financial tool in general, and about its features of storing preregistered data in particular. At extended features of registration on its side of program codes, blockchain can solve the defined task in quite an automatic degree of process, controlling on its side both document flow on the basis of distributed register of databases, taking into account the complex of all the produced goods and services, and financial distribution between the branches.

---

43   https://passionarity.org/i2balance

44   The specter of needs stipulated demographically is a specter of needs, aimed at supporting stable reproduction of healthy population in generation succession, i.e. they are the needs, which allow growing the potential of society development, providing it with everything necessary for health, education, dwelling and infrastructure.

45   In this case we used not an economic term but an expression, pointing out the shortage of the branch produced output, which leads to goods and services deficit in the chain of dependences of economy.

If we consider that bureaucracy today is a weak resemblance of this process of control and distribution, the solving the problem with a described above method, devaluates the meaning of bureaucracy as a class, aimed at solving a similar task. Moreover, the pre-established credit-financial system as a kind of global bureaucracy comes into one through the potential of blockchain technology. The idea of unification also solves the global matter of financial tool emission, which within the former logic, focused in the arms of central banks, when blockchain gives its decentralized form, controlled by those, who raises crypto-currency, spending the same kilowatt/hour of energy. Such emission shuts the interindustry balance on the invariant of price-list, based on power energy and not on a "printing machine"[46] of state central banks, controlled by global financial elites.

At strict bounding of interindustry balance to blockchain technology, it will be possible to effectively control all the financial streams of economic system. The streams process should be strictly declared with a program code of the so-called "Smart Contracts"[47], as due to this it will be possible to exclude any kind of corruption, which is often the disease of bureaucracy.

We should also mark the point of uniting the systems, which were in competing conditions at the former logic. We are talking about the unification of state economies that are on the way of automation, in the development of which there is an objective necessity in general monitoring of interindustry balances, aimed at goods and services exchange, produced within their infrastructures.

* * *

States will be formed not by territorial and cultural features based on the pre-established borders and behavioral matrixes, but they will have a form of service formations, within which nations will concentrate depending on the degree of satisfaction by the settled economic and social processes, not on language identity; this will be followed by the disappearance of many traditional cultures and nations in their common form. The process will be a push to form a united global state without boundaries and with a unified single culture, which is why it is already important to start standardizing the process of document flow management and economic interactions on the side of blockchain in order to further join the systems in future.

---

46   This word combination is quoted as printing machines are long out of trend, as money are issued by elementary operations of number adding in the databases of emission centers, due to the absence of national currency boundary to some invariant of price-list. Erstwhile currencies were bound to USD dollar within Bretton Woods Agreement, and dollar was bound to gold. In 1971-1978 the system was replaced by Jamaican currency system, inbounding dollar and starting quite an independent money printing by the USA Federal Reserve System.

47   This term is taken from blockchain Ethereum, the principles of which are broadened by the feature of registration on its side of program codes called Smart Contracts, which possess a quality to interact in the range of all the block chains, in case if they have this function programmed.

APPENDIX

Penal Cottage System

Nowadays, everybody understands the need to act within certain limits, set by the principles of today. The thing is not about the supervisors from across the sea. It is about the information transfer speed. Any system requires responsibility for the competed operations of its each element. So, here we see a two-edged sword.

On the one hand, there are some general accepted rules and regulations of policy making, and on the other hand, responsibility for its executers. At necessity to answer for parasitical mistakes, any reasonable parasite will look for informational holes, provided by our time to attract the attention of neighbor countries and other subjects of our planet. So what do we do, if states tasks are above everything, reformatories have lost the connection with time, and state authority in the eyes of partners demand constant attention?

In this situation, one needs to use the habits of parasites of their bounded or unbounded motherland.

Everybody knows their love for private territories, nature, husbandry for the benefit of their families and themselves. Sometimes it even happens so, that some characters really like to pose in the media space. Why not give them such a chance?

The idea lays in building penal, closed settlements with a high degree of correctional functions. Here is its idea. In all the consumption developed countries, access to the sphere of state control is defined by the degree of each recruit's attraction of monetary funds. This is where overall charity organizations, fund raising for the benefit of "cats and dogs of the Republic of Zimbabwe", and so on, come from. Perhaps, it is a very valuable quality in controlling structures, isn't it?

When such quality works for the sake of clans, families, transnational corporations or you yourself, maybe it has a sort of sense. But we have a task of building a powerful state without unnecessary degree of foisted illusions about the chosenness of one or another fictitious or real character.

Human's potential is always useful, even if this potential once had the impudence not to think about state needs. Our task is to reprogram a selfish carcass in order to reveal its ability to become a freeman and work at society benefit, i.e. perform funds attraction for the benefit of the entire society.

General Principles

Each character should be given an opportunity to stay alone with one's thoughts for a period of no more than 7 years, with a possibility to shorten this period to 3-5 years. The shortage of the period will depend on character's activity at participation in bonus system.

The bonus system should represent an online time meter through the system of informational supply (v. infra), with clearly preset restricted rules of bonus saving. The bonus

system should depend only on the hardworking of a settler, and should be calculated automatically. In this case, each settler will have a chance to clearly plan his husbandry (v. infra) with an eye toward early termination of his husbandry.

Husbandry Territory

A dwelling is a cottage of 30-40 square meters living space with all the conveniences. A cottage is to be built of pure wood in order to have the smell of a living tree. There may be a Russian wood stove and a banya (bath-house). It should be warm inside the dwelling in winter.

There should also be a few Ares with a black soil area. At taking up residence, a settler should be provided with all the necessary for further upsetting of the holding: a couple cubes of building boards, a hammer, a saw, nails, and so on. With the availability of wood stoves and a banya, firewood should be left on the territory of the settlement. A settler should personally build a shed to dry the wood.

If a settler eventually has a need (and it will surely appear as it will be a part of the bonus system), then he should be provided with an opportunity to raise stock and cultivate crops across his entire territory. There is only one condition: the village should be divided within the types of husbandry, so that the settlers have a chance to participate in exchange trade between each other. It is a way to inculcate the basics of husbandry and economy. The settlers will have to build all the utility facilities themselves, and settle with the limits, provided by their territories.

Each our "farmer" will cook and wash for himself, and he will be supplied with all the necessary things. If he wants a cake, let him have a recipe-book. If, he doesn't have required food ingredients, then black soil is under his feet.

Communication

Each holding should have a personal computer with access to the system of informational interaction with the outside world. This system will have all the necessary things for correctional functions towards each our character of Ostap Bender times, and it will have a form of one resource, containing everything for correctional functions.

There should definitely be an electronic reader with uploaded books, the list of which will be designed by an editorial board. The books mainly should contribute to moral development of each "farmer" and give a different view of society life, economy running, and so on. The general list should include books obligatory for reading.

The number of books read will influence the period of staying of each character on the territory of the holdings. The editorial board will evaluate the volume of the read by means of essays, uploaded on the informational interaction system. Literature analysis should be done very carefully. There should be no more than a certain amount of reviews a month, so that at constant mental activities the period shortened to 5 years. Thus, there will be an opportunity to motivate a settler of knowledge deepening, and, at proper activity, to shorten the period to the set minimum. The editorial board can make a list of questions for every book. The answers should have a free form.

The review on obligatory books should be made twice: at the initial level of husbandry and before the termination of the period.

The reader should go through debugging yearly. In case of its breakdown because of a settler, he will not be able to read up to two months. Thus, care for material values will be developed.

There will be an opportunity to communicate with family through an interaction system in texts daily for 15 minutes, and once a month in the video stream mode. It will also be possible to follow the village development in brining different crops under cultivation in order to plan the husbandry together.

Contacting Administration

Direct contacts with administration should be excluded at any reason by means of general network. The elements of interaction will be globally broadcasted through this network. Doctors, of course, will have the access to it.

There should be an escort but the settlers should not see it. If possible, the landscape should be constructed in such a way, so that it would feel cozy and had the elements of connecting nature.

Interacting with Settlers

There will be a monthly market to exchange the produced goods, food and other items of personal creativity. Weekly general meetings and others are also possible.

The surrounding area of the settlement can have a workshop with all the possible tools.

The interaction can be controlled by the bonus system.

If the settlers are in need of something on the territory of the holdings, then there should always be an opportunity to build the factories on producing anything they want, except cigarettes and alcohol, using the funds from offshore, of course if there's anything left after the presettling procedures. Every potential "farmer" will be able to take care of it beforehand.

Interacting with Outside World

It will be possible to see family on the territory of the holdings for a week annually. Only alimentary raw materials are allowed, no ready-made products.

The stream of general picture from the video cameras should be broadcasted in plain view by means of the Internet.

The results of intellectual labor should be presented for everyone to see. A moderated blog system or read literature review display system and others could be set up. Thus, people will have a chance to watch the correctional process, and if there are any deep conclusions, coming from the settlers, learn from them.

Health

The period of staying should fully depend on the bonus system and it should motivate a settler to healthy labor. To lower the degree of morbidity, each person should be supplied with everything needed to tackle the symptoms. In case of illness, a person should be taken to a sanatorium for treatment. The term of imprisonment at standard medical examination should be one-to-one.

Alcohol and cigarette consumption should be excluded on the territory of the settlement.

Termination

The further potential of an economic subject will be evaluated by the depth of understanding the passed stage of life. At a high level, one should be provided with seed money to develop one's business in any direction and under responsive state control.

There are two approaches of designing holdings life cycle:

1. Cyclically updating system. When at husbandry termination, the territory is put in original condition for another correctional settling of a different participant;
2. Releasing the village from correctional functions to inhabit the territory with state citizens.

At first approach there is a question of the quality of settler's husbandry at his full confidence that after his labor activities everything will be brought to initial sate. Obviously, the quality will be very low.

If we consider a second variant, which will contribute to the following inhabiting by state citizens of the village territory, then there are additional options.

At such task definition and at designing village security system, the emphasis should be made on their mobility when unrolling and transferring to new territories.

The order of holdings release will contribute to additional motivation of a faster settlement termination for each settler. The reason will be the market shelves that will shortly become empty as especially labor devoted settlers will leave earlier.

Spotted distribution of new penal villages with obligatory communications supply will encourage materializing the idea of low-rise construction work on the territory of the entire country.

Brief Analysis of Network Structures

Network structures analysis should start with revealing the algorithm of their functioning. It is not always that a participant of some virtual formation is aware of being its participant. In this case, the realization of information stream on the Internet comes first, which, in return, is a direct tool, influencing the work of network structures. Anyone who has met the Internet one way or another is able to build an idea of how it works. The depth of understanding will crystallize out of the depth of interaction with all the range of resources provided by the global web. We will try to shortly consider the key aspects of virtual structures operation.

A network structure, or a virtual structure, at its proficient setup can be a fine generator of structureless control. In its turn, as we know, any structure is crystallized out of structureless control. Things are more interesting with network structures. The thing is that every participant of network games is both a virtual unit and a unit forming the skeleton of a network structure. His virtual participation is defined by the degree of attention for his steps, coming from other players. The participation in forming the skeleton appears due to direct interaction with network elements. The operation runs on the principle "object-subject" in an inverse mode. So we are controlled equally by the thing that caught our attention.

At controlling impact, proficient control subject takes into account backward connections coming from a control object. Thus, backward connections of an object are a stream of information towards the subject of its control, this way being the process of interaction. In a more comprehensive sense, this section of element interaction represents a "cage" of virtual structures general control.

Interaction chains can have a structure of two types:

- *Direct information exchange between the elements*. This form makes a skeleton of a network structure, as the elements of one or another network can be revealed by the quality of information exchanged between them and their direct interaction.
- *Indirect information exchange in the form of signals, thrown into general for everyone informational field*. This form represents a cloudy structure, where the general idea of both the process inside the network and the processes, in which the net takes a direct participation, is formed.

Each virtual structure has both a cloudy form of information exchange and a form, comprising its "skeleton". The maturity of a structure like that is defined by the number of subjects, able to proficiently analyze the information from all the sources, and properly fill the matrix with a cloudy form of exchange system.

The structure achieves its virtual form due to its forming idea. **Without the idea, no network structure can exist**. There are surrogate ideas in the form of cohesive interests under the guise of the supporters of different material "values", but these structures are scattered under the external changes or transform due to the orienteer shift in the form of generally accepted interests. **The stability of network structure is defined by the stability of the idea itself**. Participants of network games, due to their virtuality, are in principle

interchangeable; however, things are more complicated. The thing is that every participant does exactly what he can, and, initially, there is no distribution of duties in network structures. Potential elements appear themselves at connecting one or another idea, and at active participation in its developments, exchanging information with the elements of virtual structures.

Virtual network structure can be divided into two types:

- *A type with a pronounced ideological center*, where the center is a core, concentrating attention on itself of a wide range of network structure elements.
- *A decentralized type,* where every element is a fully fledged network subject and is able to duly reflect external impacts and form the matrix of possible states, not waiting for the hints from the center.

The structure of the second type is a more complex subjective one. It is an evolutional cycle of the first-type structure development, and represents the center, spread in space and time, where each element will objectively form the first-type structure in the form of its followers, where the followers in general take into account the idea, born by the subject. For an external observer the interactions, forming the "skeleton" of this structure, pale into insignificance, yet inside it, direct interactions can have quite a developed character. Information exchange is possible and even necessary due to the channel of telepathic information exchange. Being at this level requires sound approach to work, primarily at its stereotypes.

The result of energy-informational interaction of virtual structures is a creation of intellectual analytical centers, generating ideas, and, consequently, new virtual networks. It happens in the case, if the formed centers have an open for the whole society information source, and if they do not pursue the purpose of secretly serving only the networks with a more complex subjective structure, generating structureless control.

Network structures are not a bulkhead of state structures but are integration within them. The thing is that the moving power of network games is a connecting idea, consequently, each functionary is both a follower of one of them or of a certain number of not contradicting ones, and is not a follower of going against the network structure, superlative in the machine.

We should especially notice the matter of creating network structures on the basis of security services aimed at fighting different networks in general. It will be like a fight with windmills, where the defining factor of special interaction between these two streams will be the fight of the aim itself against the idea connecting the network. In this case, secret services will obligatory have to integrate into one of the networks or into all the networks at once. However, a highly organized subjective network structure, generating structureless control, has a more serious factor of safety, and it is able to set, due to objective reasons, target structures to serve their interests. This process will objectively question the service of interests of structures, which are losing their connection ideas.

A network structure is a living organism with its objective panunivarsal laws of development. Consequently, it is an environment, where it is possible to nail down stored hidden knowledge due to changes analysis in the environment itself. It should be specified that

PASSIONARITY

this knowledge is not a result of prejudices or prejudgments, but a tool to achieve the goal. **Any knowledge strengthens psyche within the meanings that this knowledge bears**.
